

# MOCs in Arches

Ada Nebot Gomez  
Reported by Laurent Michel

# Arches at a Glance

<http://www.arches-fp7.eu>

New tools will be developed for cross-correlation with extensive archival resources, producing well-characterised multi-wavelength data in the form of spectral energy distributions for large sets of objects. We plan to create high reliability source crossidentifications extracted from the best archival astronomical catalogues so as to cover the widest range in wavelength. These cross-matches will then be used to build fully calibrated spectral energy distributions (SEDs). Most importantly, we will validate the quality of these products by using them in the framework of a small number of pilot projects tackling forefront astrophysical topics, providing the route for further enhancement.

ARChES will considerably increase the usability and research potential of the XMM-Newton X-ray catalogue, enhancing it with key multi-wavelength resources and distributing these results to the international community.

32 months starting from 01/2013  
Strasbourg, Santander, Madrid, Potsdam and Leicester

# The ARChES Project

---

- 3XMM catalogue enhancement
  - Remove suspicious detections
  - Flag sources in order to improve their reliability
  - Merge multiple detections
- **Accurate cross correlation with the 3XMM sources in all energy ranges (radio to  $\gamma$ )**
  - Focus of the present topic
- Building SEDs for 3XMM sources
  - Likely other connections with VO standards
- Checking the results on real science cases.

## 1. Selection of the candidate catalogue

- Make sure that all 3XMM sources are in the footprints of catalogues covering all wave lengths.
- Computing intersection between 3XMM and these catalogues.
  - Catalogues intersect but without correlation -> upper limit values.
  - upper limit values can not be inferred from the absence of correlations returned by a simple cross match.
- Need catalogue footprints.

## 2. Multi-catalogue cross match

- François Xavier's job. *-out of the present topic-*

# Candidate Catalogue Selection

- **Get of all Vizier catalogues intersecting with the 3XMM.**
  - Query by MOCs
- **Select among these catalogues those which are potentially interesting**
  - Interesting information on magnitudes, flux and counts from Radio to gamma.
- **The most interesting catalogues will be selected later by coverage and both photometric and position accuracy**
  - The goal is to get for each 3XMM source counterparts extracted from a catalogue set with the best balance between WL coverage, 3XMM overlapping and position accuracy

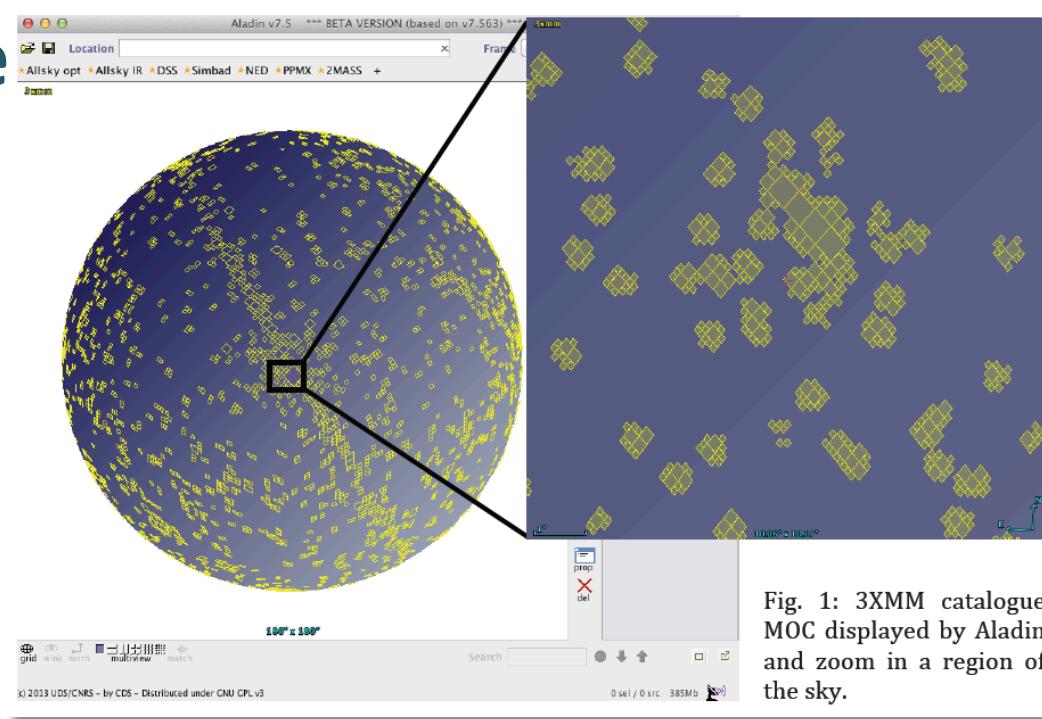

# Operating Mode

- 1. Make the 3XMM footprint**
- 2. Computing the intersection between the 3XMM and all Vizier tables**
- 3. Table selection by UCD**
- 4. Compute which sources are in MOCS**
- 5. Computing the fraction of the 3XMM area covered by each catalogue**
- 6. Checking astrometric and photometric accuracy**

# 3XMM footprint

- Computed with STILTS
  - Use of the *pixfoot* function
- Resolution fixed to 6.87" (healpix level 9)
  - Good enough to compute intersections between catalogues
- Stored in a fits file
  - Notice that the 3XMM footprint is very fragmented

- **Get the MOCs for all the 12237 (at that time) Vizier catalogues**
  - Available at the CDS MocServer
  - HTML/JS page hacked to avoid tens of thousands clicks.
- **Using the MocServer to generate the MOCS of all intersection**
  - A few seconds
  - 10636 Vizier Catalogue intersect with 3XMM
- **Delivery of 10636 MOCS (3XMM  $\cap$  Catalogue)**
  - Output in ASCII in the current prototype (open issue)

# MocServer (feedback)

## MocServer

Returns ASCII MOCS

A possibility of  
filtering the input  
catalogues by UCDs  
would be very  
helpful

# Table selection by UCD

- **Some table intersection with the 3XMM are not all useful.**
  - No relevant photometric parameters e.g.
- **Selection of catalogues of interest by UCDs**
  - Catalogue with information on magnitude in different energy range
  - Need to be properly implemented (TAP service e.g.)
  - Requires queries on the catalogue descriptions.
  - Cannot be done before the MOC generation because the MultiMoc has no UCD filtering option.
- **6700 catalogues selected**
  - 8584 catalogues selected, but some have information in multiple energy bands

UCD	# catalogues
em.gamma	59
em.X-ray	764
em.UV	193
em.opt	4.566
em.IR	1.806
em.mm	226
em.rad	970

- Can be done with STILTS, but requires MOC in FITS format
  - Conversion of all MOCS in FITS using the Aladin API (hack)
- **Delivery of one table per Vizier catalogue with the 3XMM sources contained in its MOC (not a cross match)**
  - Source X + pos + ID

# Fraction of 3XMM area covered by each catalogue

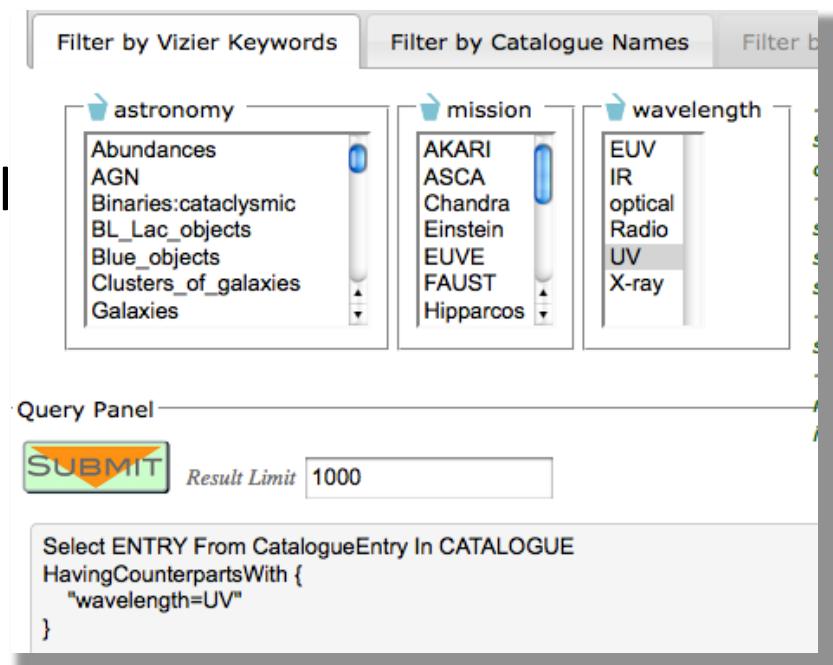

- **Attach a sky coverage to each Vizier catalogue**
  - Could help for the final selection catalogue
- **It could be helpful to have a sky coverage per galactic latitude or other parameters.**
  - Could be done with IDL from “source in MOC” files
  - Relevant for science cases.  
Doing the galactic science in the galactic plane only e.g.

# What next

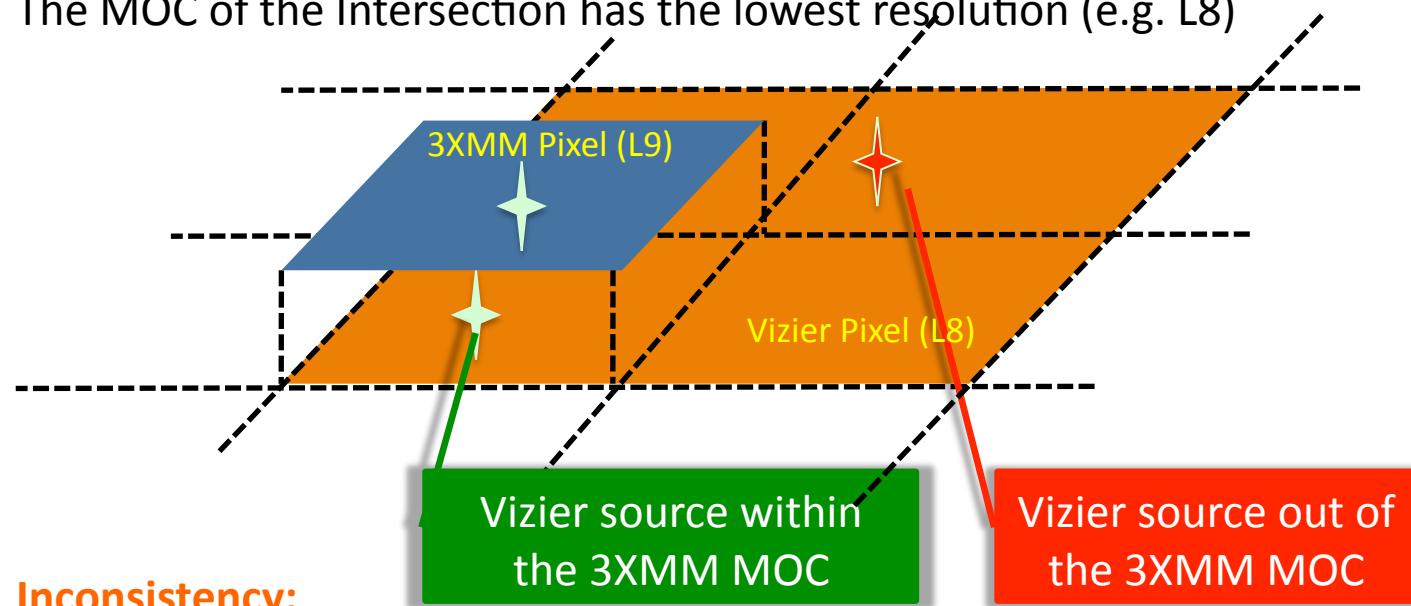

---

- **Compute cross correlation with identification probabilities**
  - FX Pineau
- **Generate SED for all 3XMM sources having a counterpart covering all the EM spectrum**
- **Put the results online**

# Healpix Resolution Issue

- **If the 2 catalogues have a different healpix resolutions**

- The MOC of the Intersection has the lowest resolution (e.g. L8)

- **Inconsistency:**

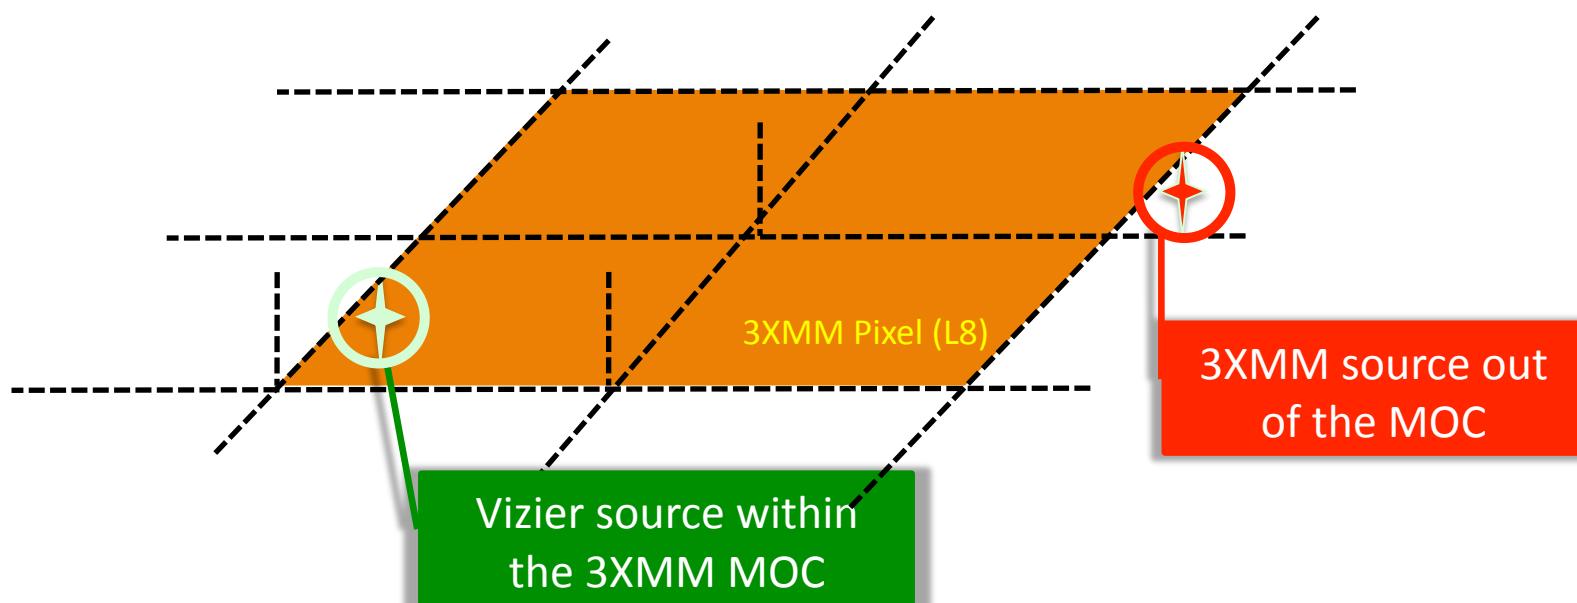

- Let's take a source (red) which belongs to the intersection but not the 3XMM footprint.
- AS it doesn't belong to the 3XMM footprint, so it should not be in the intersection.
- Although it IS in the intersection.

- No solution yet to this issue.

- Degrading the 3XMM Moc: **too bad**
- Re-compute on demand some Vizier MOCs with the right resolution: **takes time?**

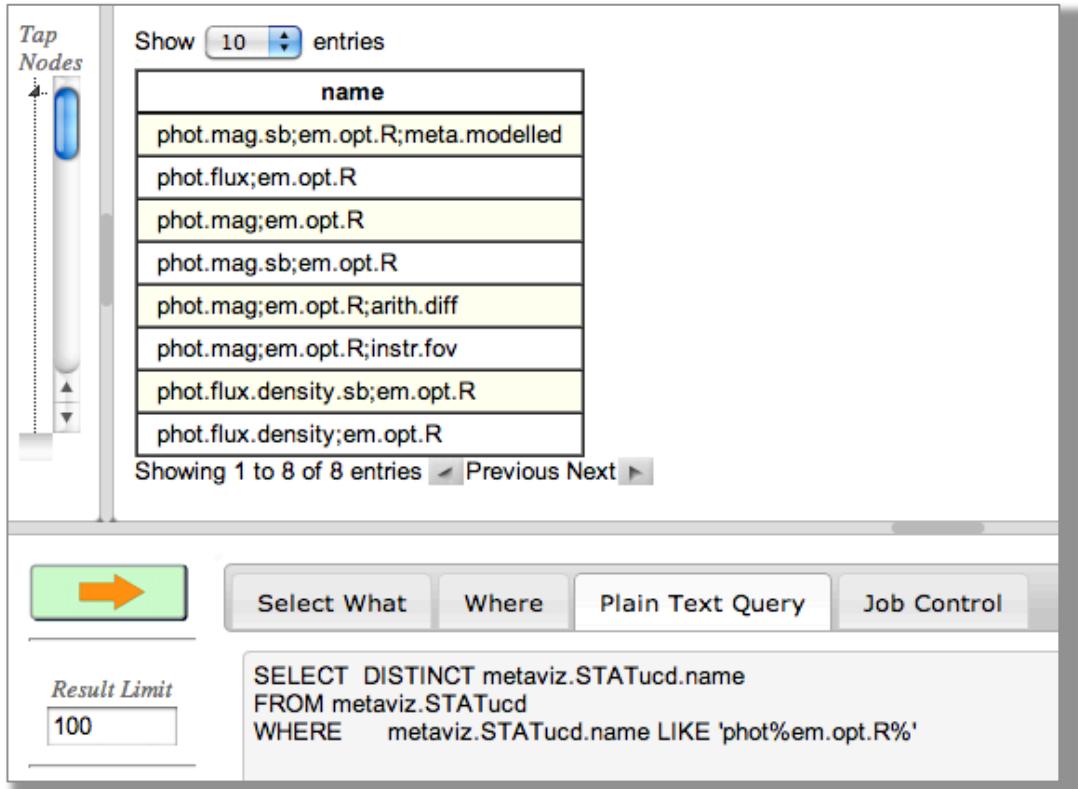

# Healpix: Error Issue

- **The MOCs do not take in account the errors**
  - The healpix pixels only contain the sources having their barycentre into it.
    - The footprints should be a little bit extended to include side sources.
  - That could be easily fixed for circular errors with the Healpix library.
  - But things are getting worse with ellipsoidal errors .....

# Querying by UCDs

- **Querying catalogues by UCDs is not straightforward.**
  - Requires un good knowledge of the vocabulary

The screenshot shows the ARChES interface with a sidebar labeled "Tap Nodes" and a main panel displaying a list of UCD names. Below the list is a query editor with various buttons and fields.

**Tap Nodes**

# Conclusions

---

- **This catalogue selection couldn't be achieved without both MOCs tools and UCDs.**
  - Let's say without the VO tools
- **Some issues require improvement**
  - ≠ resolutions
  - Errors handling
  - Conditional catalogue coverage
- **This work might give some idea for a future Web service doing the same job in a more general case.**
