# 1 Definition of atoms and words

A UCD is a string which contains textual tokens called 'words', separated by semicolons(;). A word is composed of 'atoms', separated by periods(.). The hierarchy is as follows:

atoms --> words --> composed words

UCD1+ are either single words, or a composition of several words.

UCDs are "controlled" (through a process that is also indicated in the reference document above). Control is exercised at the level of words (UCD1+) and at the level of the vocabulary (atoms) used to form words. A consistent list of atoms will be maintained, making sure that the same atom always means the same thing, even if used in combination with different other atoms.

## 1.1 Definition of atoms

Atoms are defined following these guidelines:

1. Abbreviations are kept to a minimum, and only if the result is not ambiguous. (**ra**, **dec** are acceptable, but **t** is ambiguous: **time** and **temperature** are used instead.)
2. Atoms are not hyphenated. The separation is marked by a capital letter to help readability (position angle = **posAng**) unless the composed word has a well known acronym (signal to noise ratio = **snr**) or short form (standard deviation = **stdev**).

## 1.2 Definition of words

The list of UCD1+ words presented in this document was initially generated applying the rules and recommendations of PR-UCD-20040823 to catalogues/tables in Vizier. The original motivation was to transform old UCD1 into an improved version, trying to build a list of combinations of new words that could describe all the existing UCD1 terms.

The list of UCD1+ words is maintained by the UCD Scientific Board, following the procedure defined in the UCD Recommendation document (<http://www.ivoa.net/Documents/latest/UCD.html>), and described in detail in <http://www.ivoa.net/Documents/latest/UCDlistMaintenance.html> .

## 2 The structure of the UCD1+ tree

All existing UCD1+ words are grouped into 12 main categories. These categories are expressed by the first atom of the word, whose possible values are:

1. **arith** (arithmetics)

This section includes concepts involving or indicating some mathematical operation performed on the primary 'concept' or just the presence of an arithmetic factor or operator.

2. **em** (electromagnetic spectrum)

This section describes the electromagnetic spectrum, either in a monochromatic way or in predefined intervals. The complete list of proposed bands (in seven classical regions of the e.m. spectrum: radio, millimeter, infrared, optical, ultraviolet, x-ray and gamma-ray), can be found in the document [Note-EMSpectrum-20040520](#)

3. **instr** (instrument)

This section includes all quantities related to astronomical instrumentation, e.g. detectors (plates, CCDs, etc.), spectrographs, and telescopes (including observatories or missions), etc.

4. **meta** (metadata)

This section includes all the information that is not coming directly from a measurement, and information that could not be included in other sections.

5. **obs** (observation)

In principle under this section should go all words describing an observation (the name of the observer or PI, the observing conditions, the name of the field). In practice, the section is very 'thin' and could be deleted, if the sparse content could be housed elsewhere.

6. **phot** (photometry)

All the words describing photometric measures are included in this section. The definitions distinguish between a flux density (flux per unit frequency interval), a flux density integrated over a given e.m. interval (flux if expressed linearly, mag if expressed by a log), or a flux expressed in counts/s (if the setup of the detector is photon counting observing mode). 'Colors', which are differences of magnitudes (i.e. ratios of fluxes) measured in different bandpasses, are also included.

## 7. **phys** (physics)

This section includes atomic and molecular data (mainly used for spectroscopy) and basic physical quantities (temperature, mass, gravity, luminosity, etc.)

## 8. **pos** (positional data)

This section describes all quantities related to the position of an object on the sky:

- Angular coordinates, and projections from spherical to rectangular systems.
- Angular measurements in general (the angular size of an object is in this section, its linear size is in the **phys** section).
- The WCS FITS keywords.

## 9. **spect** (spectral data)

For historical reasons, photometric data taken in narrow spectral bands with instruments called spectrographs are classified as spectroscopic data. These definitions should not be confused with those in the **em** category. **em** represents the independent variable, or dispersion axis, and **phot** and **spect** describe the dependent variable, or flux axis.

## 10. **src** (source)

This is a rather generic section, mainly devoted to source classifications. Variability, orbital, and velocity data are also included in this section.

## 11. **stat** (statistics)

This section includes statistical information on measurements.

## 12. **time** (time)

Quantities related to time (age, date, period, etc.) are described in this section.

# Appendix A: List of valid words

All words are preceded by a 'syntax' code that can help in the process of building composed UCD1+.

1. The code “P” means that the word can only be used as “primary” or first word;
2. “S” stands for only secondary: the word cannot be used as the first word to describe a single quantity;
3. “Q” means that the word can be used indifferently as first or secondary word;
4. “E” means a photometric quantity, and can be followed by a word describing a part of the electromagnetic spectrum
5. “C” is a colour index, and can be followed by two successive word describing a part of the electromagnetic spectrum;
6. “V” stands for vector. Such a word can be followed by another describing the axis or reference frame in which the measurement is done

## Changes from v0.1

1. Descriptions of the words were improved.

4. The **phot.color** section was significantly simplified.
5. Missing nodes of the tree were added (e.g. **em.gamma**, **em.mm**, **pos.sg**).
6. Creation of new words: **em.wavenumber**, **meta.ucd**, **stat.error.sys**
7. Typos were corrected in **em.opt.\*** units and a few other descriptions.
