

Registry session orientation

What TJ could do over lunch

View from afar:

Registry
(e.g., GAVO, EuroVO, NAVO)

Relational database (e.g., Postgres, MySQL)

Tables:

resource
capability
res_schema
res_table
interface
...

Columns:

ivoid
res_type
short_name
reference_url
...

Standards:

VOResource: basic data model for resource info, schema defined with xpath

VODataService: extends VOResource to describe services, tablesets, collections, **Vocabularies, UCDs, ...**

IVOA Identifier

Extensions: extend other standards (e.g., DAL, TAP, etc.) for registry-specific needs, expressed in xpath ...

Harvesters: don't ask me, I only work here.

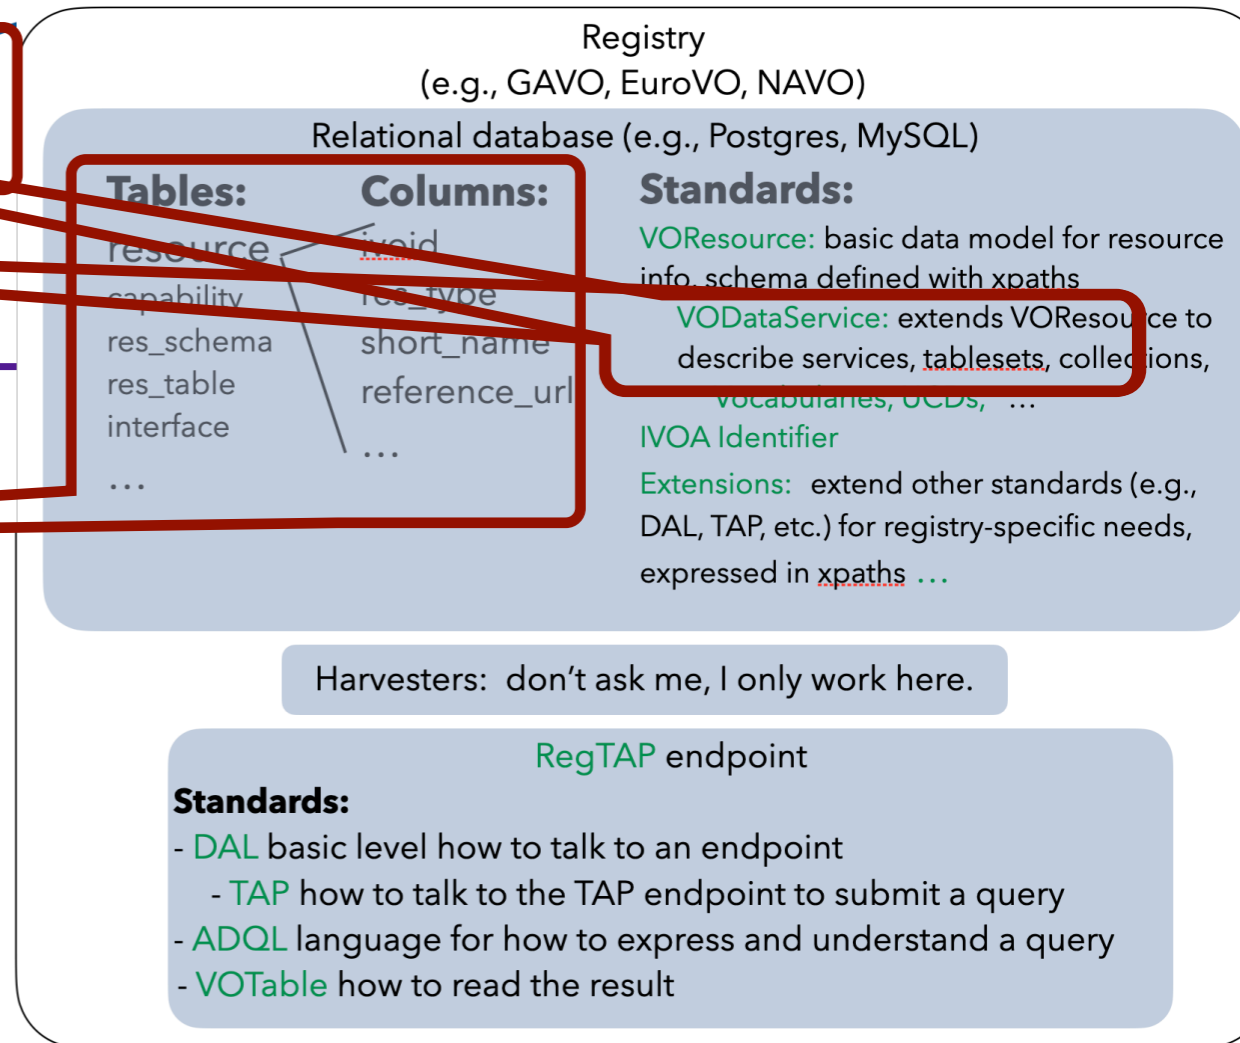

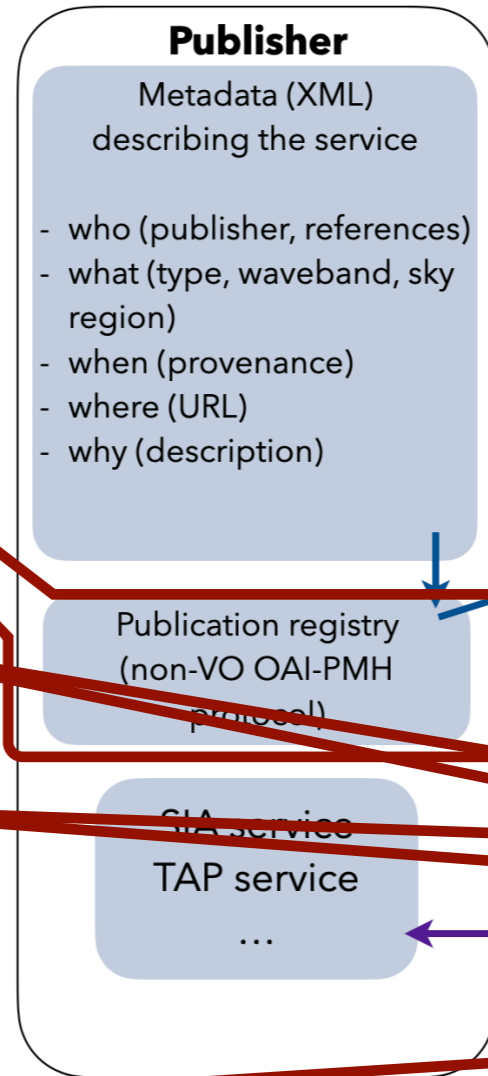

RegTAP endpoint

Standards:

- **DAL** basic level how to talk to an endpoint
 - **TAP** how to talk to the TAP endpoint to submit a query
- **ADQL** language for how to express and understand a query
- **VOTable** how to read the result

So what are we talking about today?

- PatD on **OAI publishing** registry
- RenaudS on linking **capabilities with tablesets**
- MarkusD on **product type** served
- TessJ on registry **spring cleaning**; what do the clients see?
- RenaudS on **mini-resources**

?
