

MOC: Multi Order Coverage maps

(*Thomas Boch, Pierre Fernique, Mark Taylor*)

IVOA Interop Urbana Champaign, May 2012

Brief reminder

- A **MOC** is a simple and powerful method to specify sky regions (datasets coverage)
- **Goals:** provide visualization, very fast comparisons of coverages, and data access methods
- **How:** based on HEALPix sky tessellation

A sky region

=

a list of HEALPix cells,
grouped hierarchically

Abstract

This note describes a simple and powerful method to specify sky regions. The goal is to have a way for providing very fast comparisons and data access methods. The principle is based on HEALPix sky tessellation. It boils down to defining a list of sky cells, grouped hierarchically. This method has been tested and validated in two tools: Aladin and Topcat, and in a front-end tool for VizieR catalogs.

Java library available at

**[http://cds.u-strasbg.fr/resources/
lib/exe/fetch.php? media=mocsrv.jar](http://cds.u-strasbg.fr/resources/lib/exe/fetch.php?media=mocsrv.jar)**

Two encoding formats

performance

versatility

FITS MOC: designed to be processed as fast as possible
(serialization/deserialization in one fast step)

FITS binary table

JSON MOC: easy to write, to read and to parse

```
{"1": [1,2,4], "2": [12,13,14,21,23,25], ...}
```

Demo I

- Visualize in Aladin a VizieR catalogue MOC
- Find VizieR catalogues with a common intersection
- Compute the intersection between 2 VizieR catalogues MOCs

MultiMoc tester
...just to demonstrate MOC potentialities...

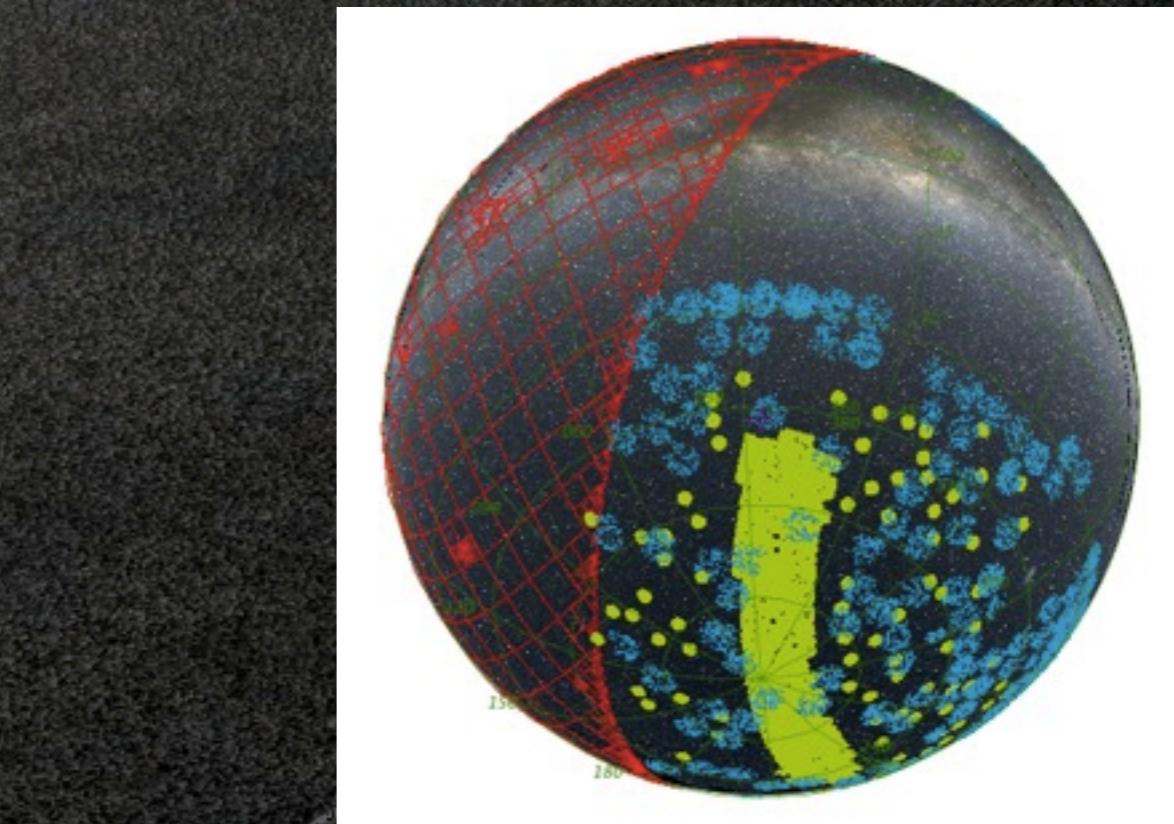

This basic form provides an access to a remote server (tomcat+java servlet) containing about 10.000 VizieR table MOCs and a few Aladin image surveys MOCs. Select one catalog/survey (radio button) and you will see appear immediately the list of data set which intersect it. You can also drag & drop one of them into [Aladin \(beta\)](#) for displaying it. Use the two bottom fields for providing by hand a basic MOC, or just a sky position. A MOC (Multi-Order Coverage map) is a way to describe the sky region covered by a data set, such as a source catalog, a pixel survey, or others. A java API is available [here](#).

9948 MOCs loaded (190MB)
(loaded in 630ms by Tomcat server)

I/283A/npm2
intersects 4898 catalogs/surveys
(computed in 258ms)

2451) [I/ApJ/658/99/table1](#) (311 cells)
2452) [I/A+A/466/137/w2phot](#) (3 cells)
2453) [J/PASP/111/685/table1](#) (14 cells)
2454) [I/A+A/524/A25/planets](#) (6 cells)
2455) [I/A+A/377/945/table3](#) (12 cells)
2456) [I/AJ/127/2002/table1](#) (6 cells)
2457) [I/A+A/431/565/table3](#) (214 cells)

A few figures

2.5 sec	Load the 7,000 VizieR MOCs at level 8
7 ms	Query by HEALPix cell: <i>amongst 7,000 VizieR tables, which tables have data in a given cell ?</i>
90 ms	Query by MOC: <i>which VizieR tables intersect a given MOC ?</i>
30 ms	Generation of MOC intersection <i>(between SDSS level 10 and GALEX level 8)</i>

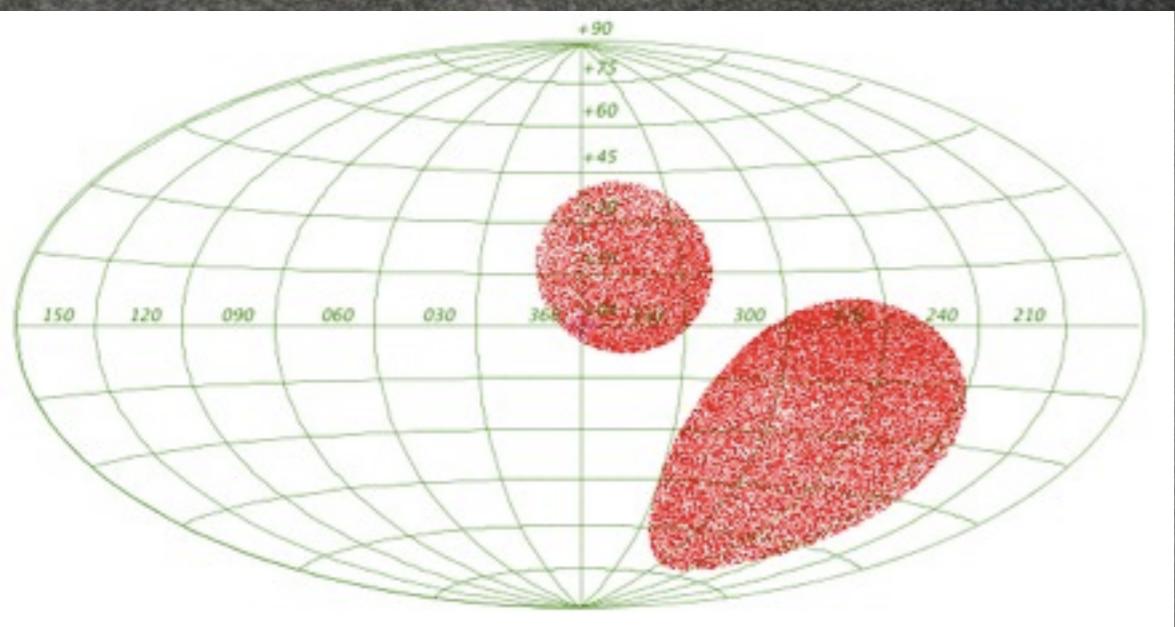

MOC and Multicone in TOPCAT

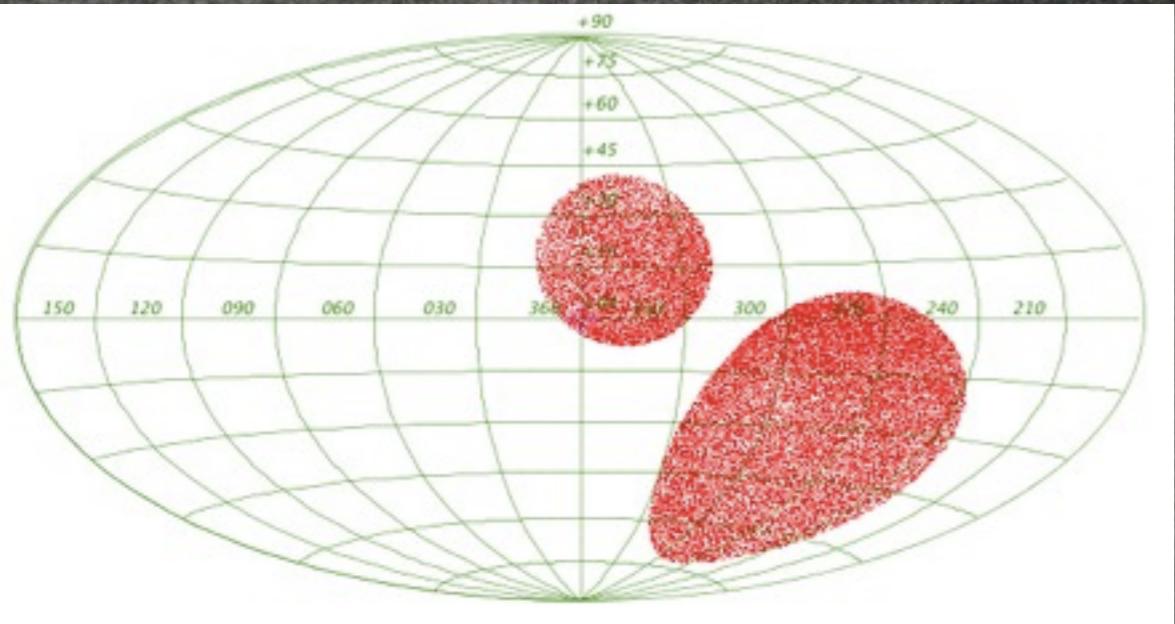

- Popular feature
 - Positional cross-match between a local table and a remote one
 - Multiple cone search queries
- Naive approach:
 - one query per row of the local table
 - in some cases, many unnecessary queries

IVOA Interop Urbana Champaign
May 2012 - T. Boch

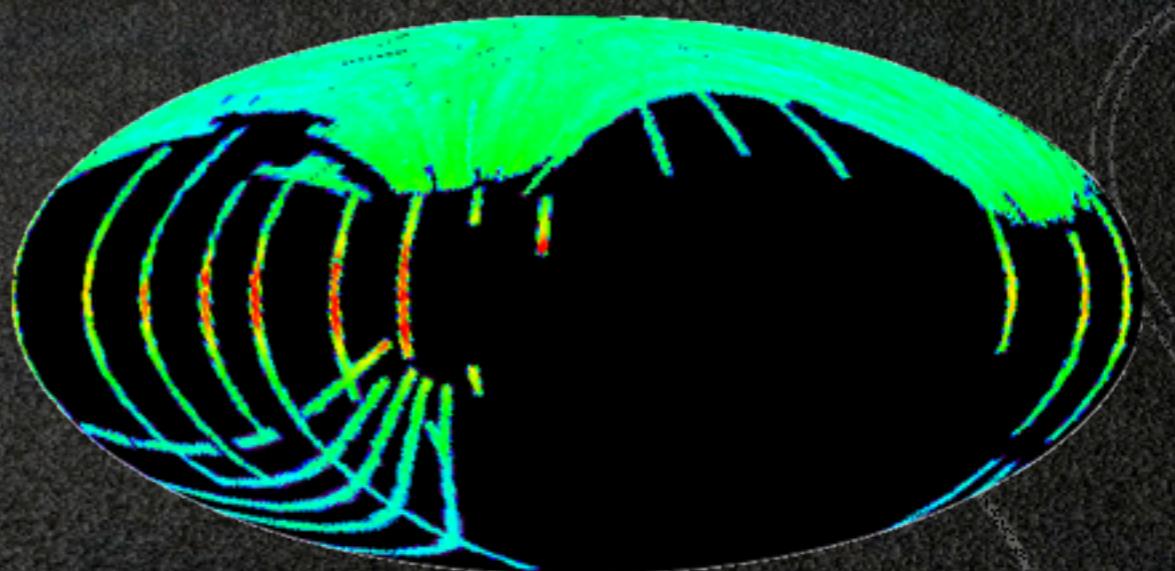

Local table (22k rows)

Local table
(22k rows)

(SDSS DR7)

**Need knowledge of coverage
for CS services**

getMoc service

- Provides the global sky coverage (MOC) for a cone search resource
 - *Input:* cone search base url (+ nside)
eg: <http://alasky.u-strasbg.fr/footprints/getMoc?baseUrl=http%3A%2F%2Fvizier.u-strasbg.fr%2Fviz-bin%2Fvotable%2F-A%3F-source%3DIII%2F105%26>
 - *Output:* required MOC (serialized in FITS) or 404 error
- Available MOCs :
 - All 7,000+ registered VizieR cone search services
(<http://alasky.u-strasbg.fr/footprints/tables/vizier/>)
 - Some cone search services managed by ROE
(MOCs computed and provided by Mark Holliman) :
UKIDSS, SDSS DR8, VISTA VHS

Demo

Multiple Cone Search Parameters

Cone Search URL: <http://vizier.u-strasbg.fr/viz-bin/votable/-A?-source=II/294&>

Input Table: 1: mytable.vot

RA column: _RAJ2000 degrees (J2000)

Dec column: _DEJ2000 degrees (J2000)

Search Radius column: 1.0 degrees

Verbosity: 2 (normal)

Output Mode: New joined table with best matches

Parallelism: 5 Error Handling: abort

- Feature available in TOPCAT pre-release
(<ftp://andromeda.star.bris.ac.uk/pub/star/topcat/pre/>)
- makes use of VizieR tables MOC, in order to discard positions without potential counterparts
- Collaboration between CDS and Mark Taylor

Perspectives

- In VizieR: provide access to catalogue data for a given MOC ("give me the sources *intersecting this MOC*")
- Gather MOCs of non-VizieR cone search services (we provide with a Java tool to generate a MOC from a list of positions)
- MOCs to describe coverage of S*AP/TAP services ?
- Replace the getMoc service with a link to the MOC at the registry level ?
