

SimDAL

Implementations at Paris Observatory

David Languignon & Franck Le Petit

SimDAL version 1.0

New version of WD SimDAL 1.0

Previous version:

- presented at Sesto InterOp
- WD published in September 2015

New version:

- Integration of most feedbacks (some remain for version 2.0)
 - pagination
 - API homogenization / REST
 - datasetID, ...
- Clarifications of several points

Implementations

(end 2015 - beginning 2016):

- Paris
- Madrid

Simulation Data Access Layer

Abstract

Status of This Document

This is an IVOA Working Draft for review by IVOA members and other interested parties. It is a draft document and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use IVOA Working Drafts as reference materials or to cite them as other than "work in progress".

A list of current IVOA Recommendations and other technical documents can be found at <http://www.ivoa.net/Document>

Contents

1	Introduction	4
1.1	Role within the VO Architecture	4
2	Overview	5
2.1	Rationale	5
2.2	SimDAL	5
2.3	SimDAL and the Simulation Data Model	6

SimDAL version 1.0

SimDAL has 3 components:

SimDAL Repository:

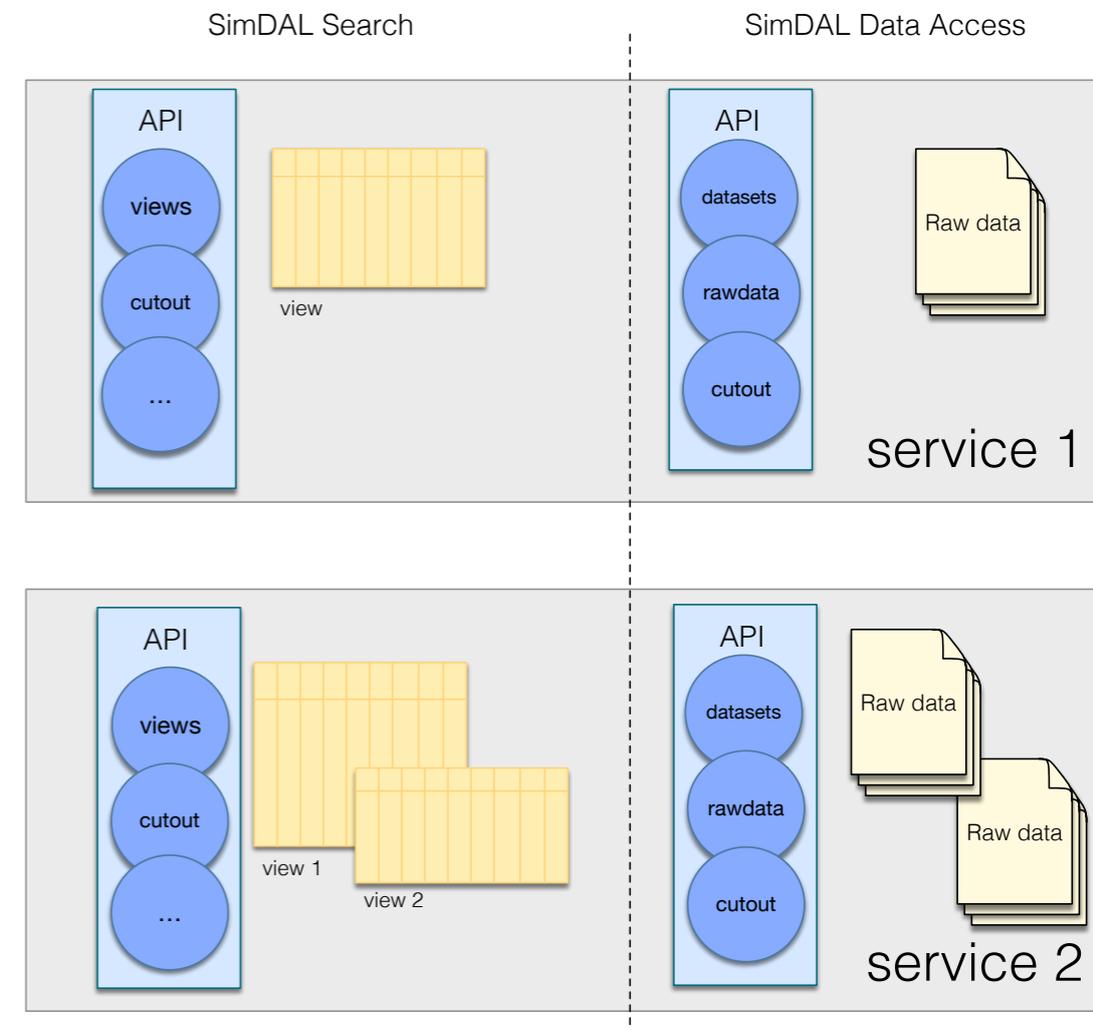

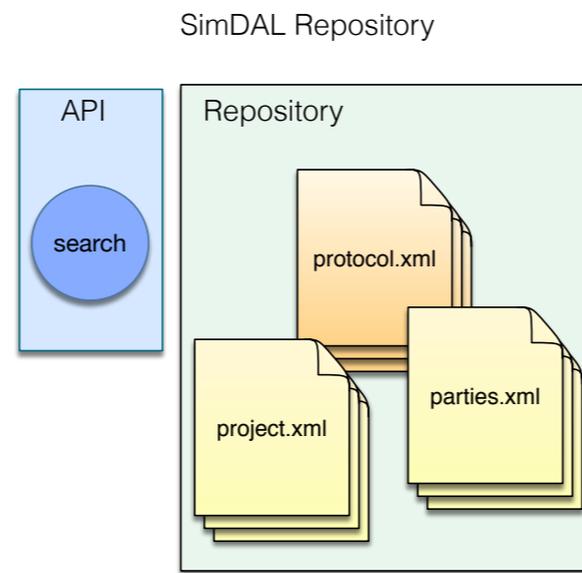

- Discover services publishing simulations in the VO
- Get the SimDM descriptions of codes and projects

SimDAL Search:

- Discover simulations / datasets in a project
- Search on precise quantities (range / values):
 - Input parameters
 - Statistics

SimDAL Data Access:

- Access simulation raw data
- Extraction / cutout to access part of the raw data

SimDAL APIs design

Manage large & heterogeneous data

Level of raw data

Simulations can produce

- large output data files
- heterogeneous data

SimDAL answer:

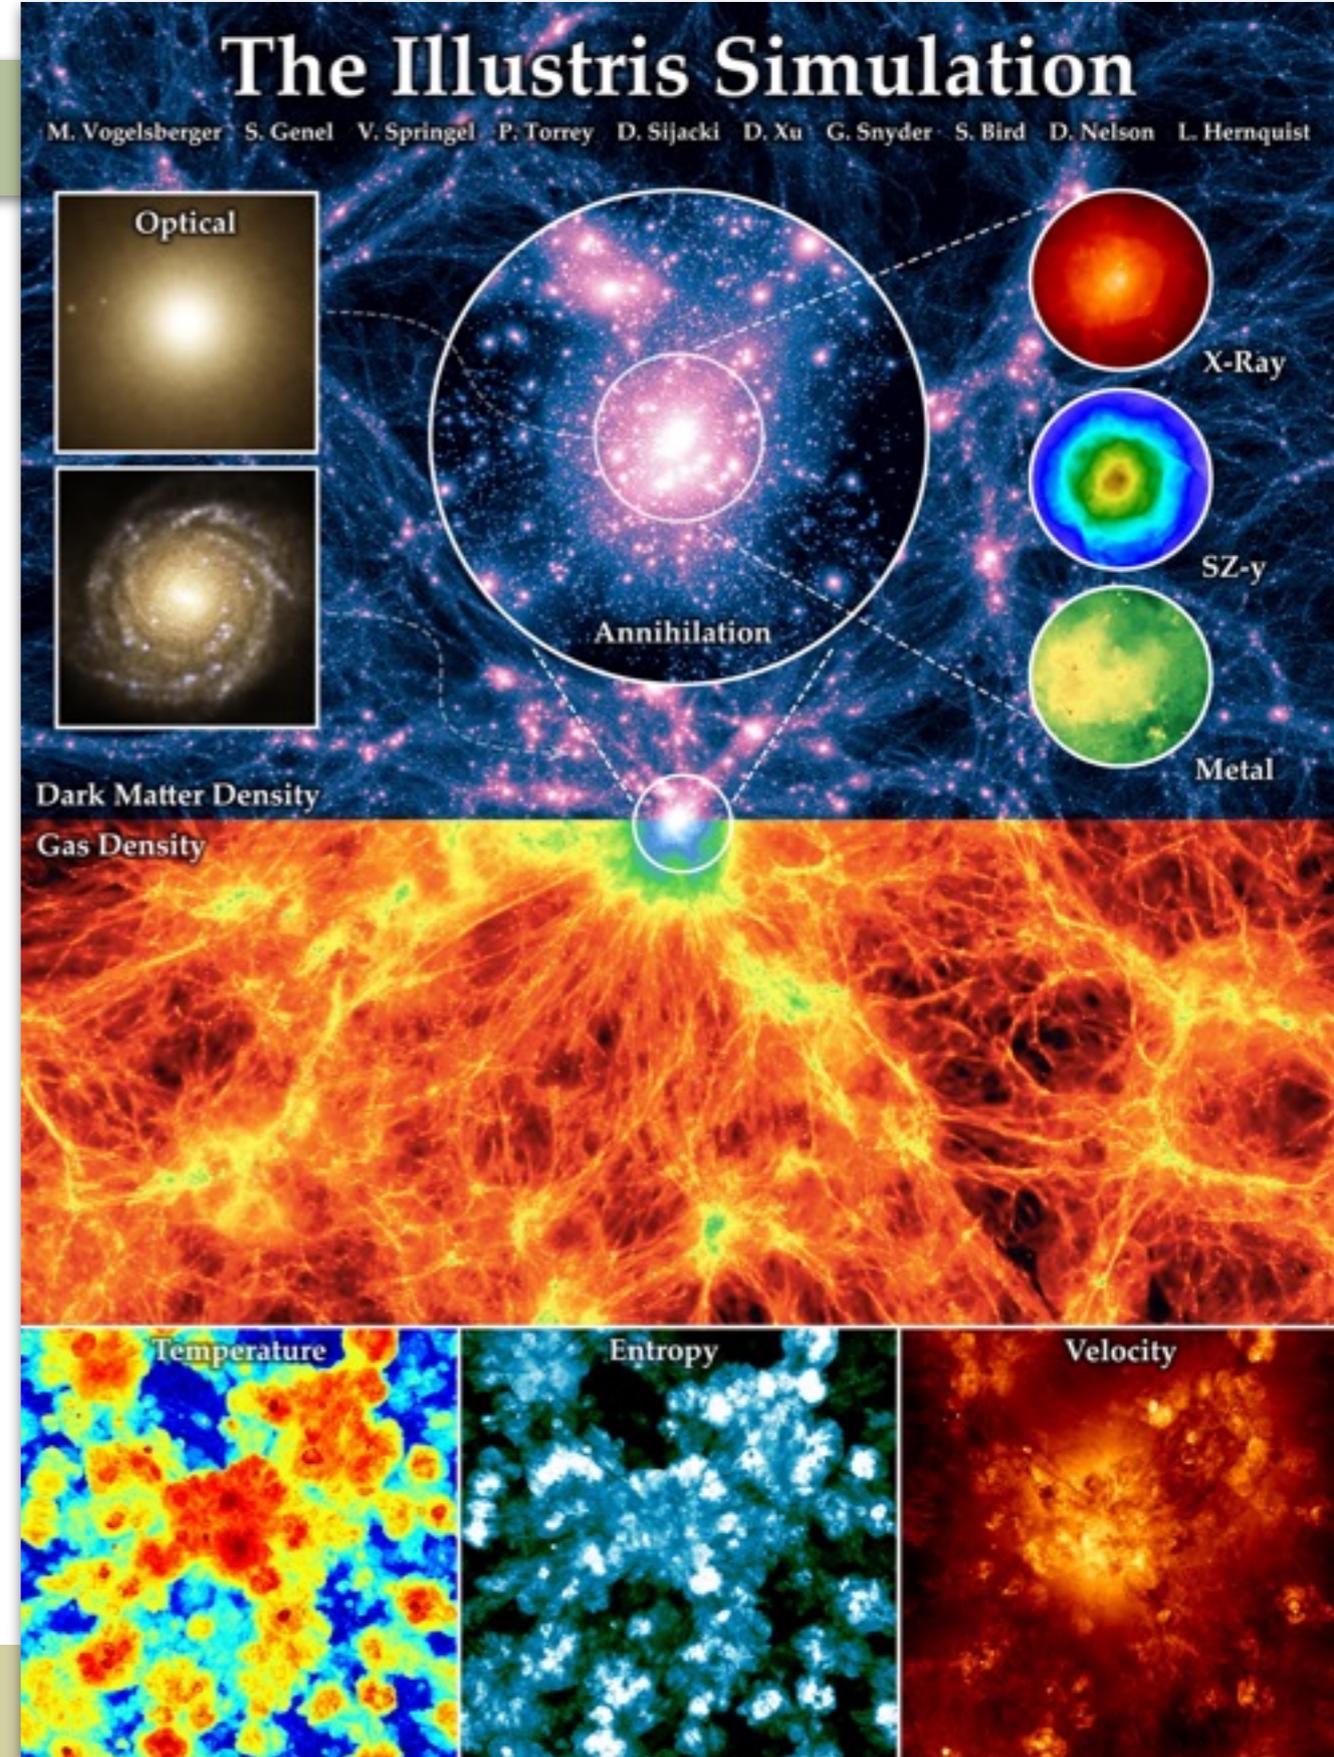

- asynchronous cutout

Level of meta-data

- Simulations can be characterized by large number of quantities
- High dimensionality databases

SimDAL answers:

- notion of views
- no connexion between the standard and the implementation
- pagination

Illustris simulation
Vogelsberg et al.
Data volume: 250 Tb

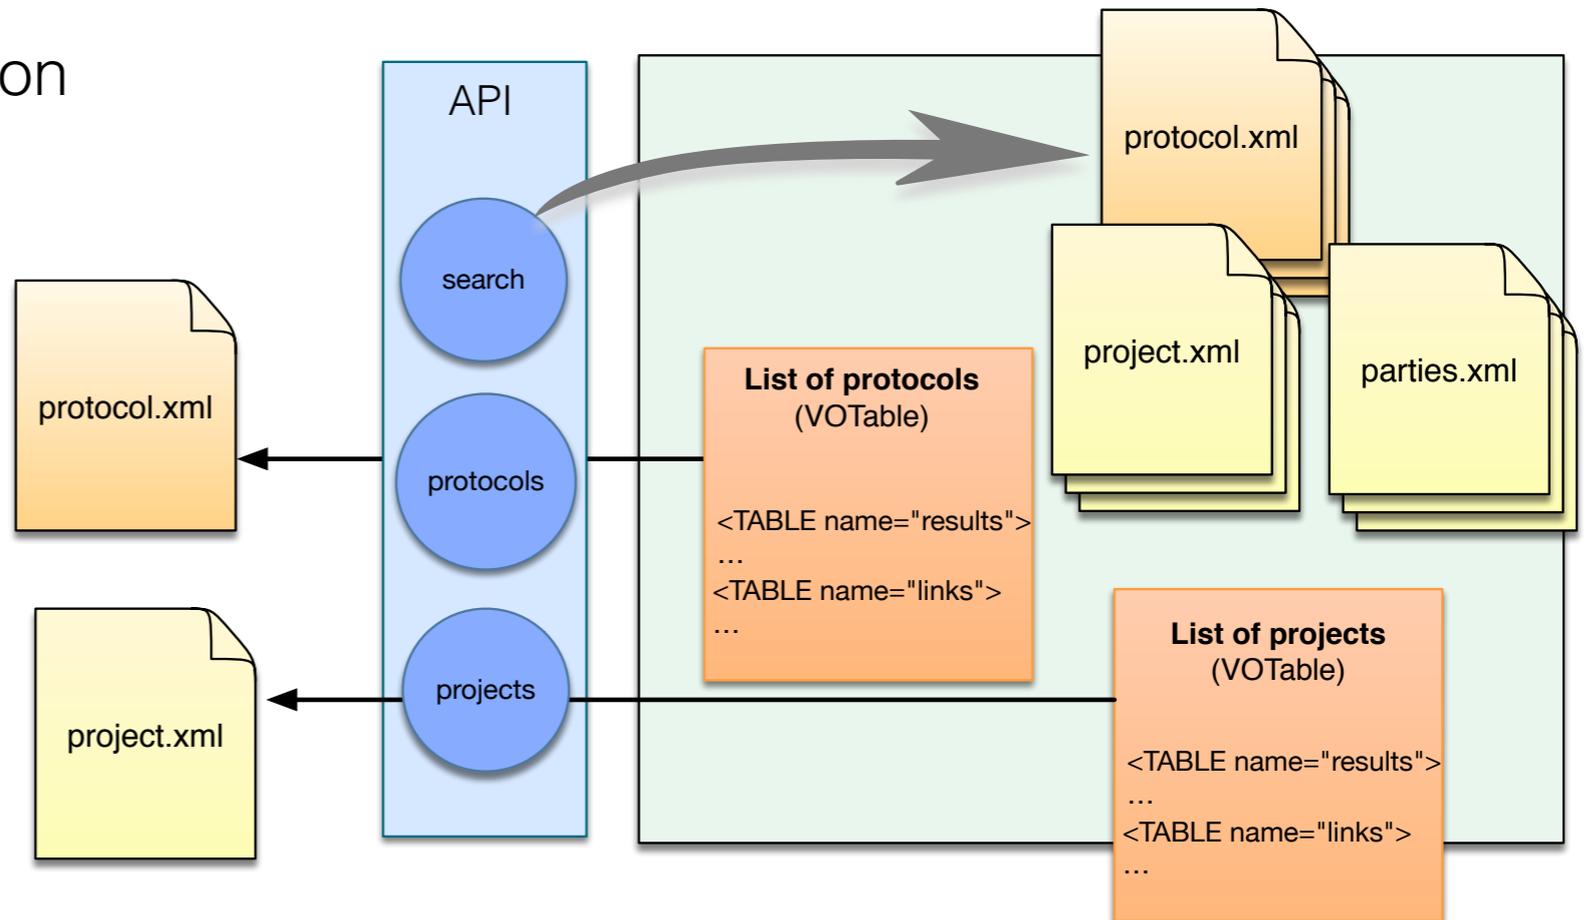

SimDAL Repository

Goal: discover services publishing theoretical data / projects

Repository stores SimDM serialization of protocols and projects

Contains

- full description of codes
- full description of projects published in the VO

{search}

- Text search in whole documents

<http://<SimDAL Repository URI>/search?q=spectra&q=star>

➔ VOTable with publisher, project ID, document, match, rank, ...

{projects}

- Access to SimDM serialization of projects

{protocols}

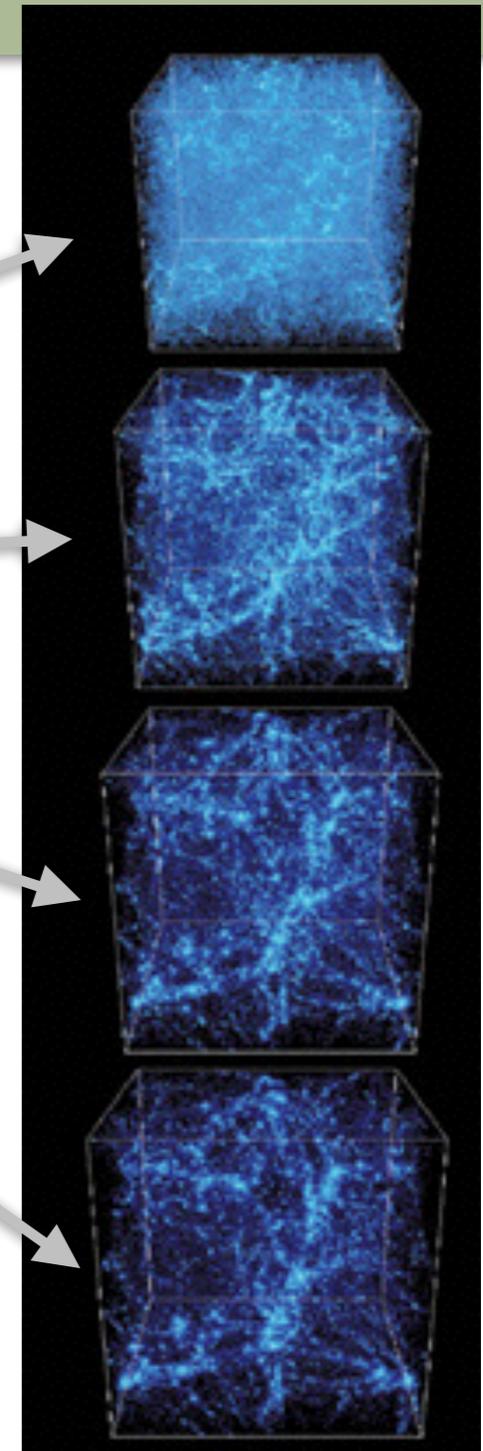

- Access to SimDM serialization of protocols

Example for N-body simulations

cosmology	resolution	redshift	outputdataset_pubdid
LCDM	1024	0.0	MyDataset_cube_1
LCDM	1024	1.0	MyDataset_cube_2
LCDM	1024	4.0	MyDataset_cube_3

...

Input Parameters

Property value

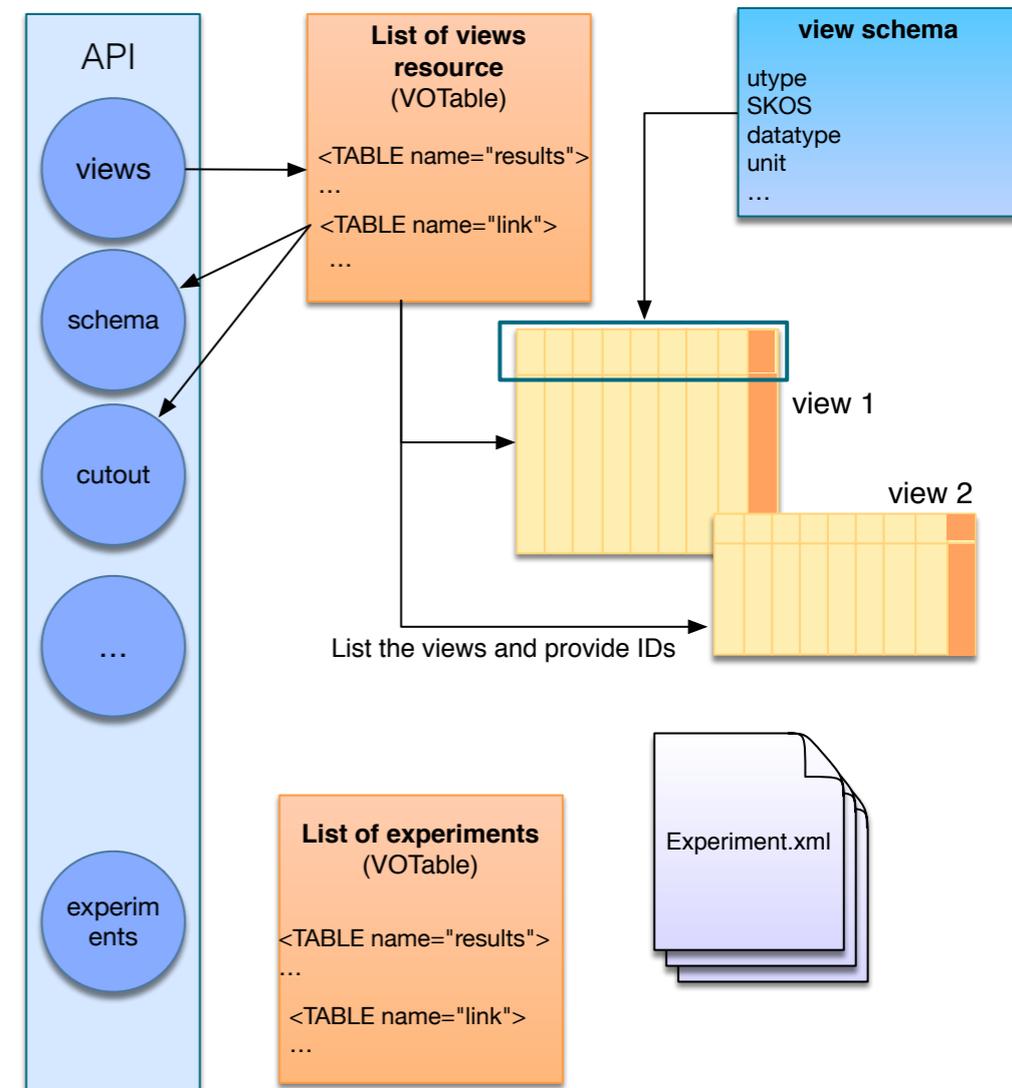

Piece of universe at various redshifts

SimDAL Search

Resources of SimDAL Search API:

- {views}**
 - Provide the list of views to discover simulations
- {experiments}**
 - list of the experiments
- {fields}**
 - get information on a specific field of a view
- {cutouts}**
 - Search / cutout in a view
- {cutouts-preview}**
 - Preview summary of the cutout

SimDAL Search

{cutouts}

- Search / cutout in a view

Example: Query to find stellar spectra with effective temperatures between $5 \cdot 10^4$ and $8 \cdot 10^4$ K

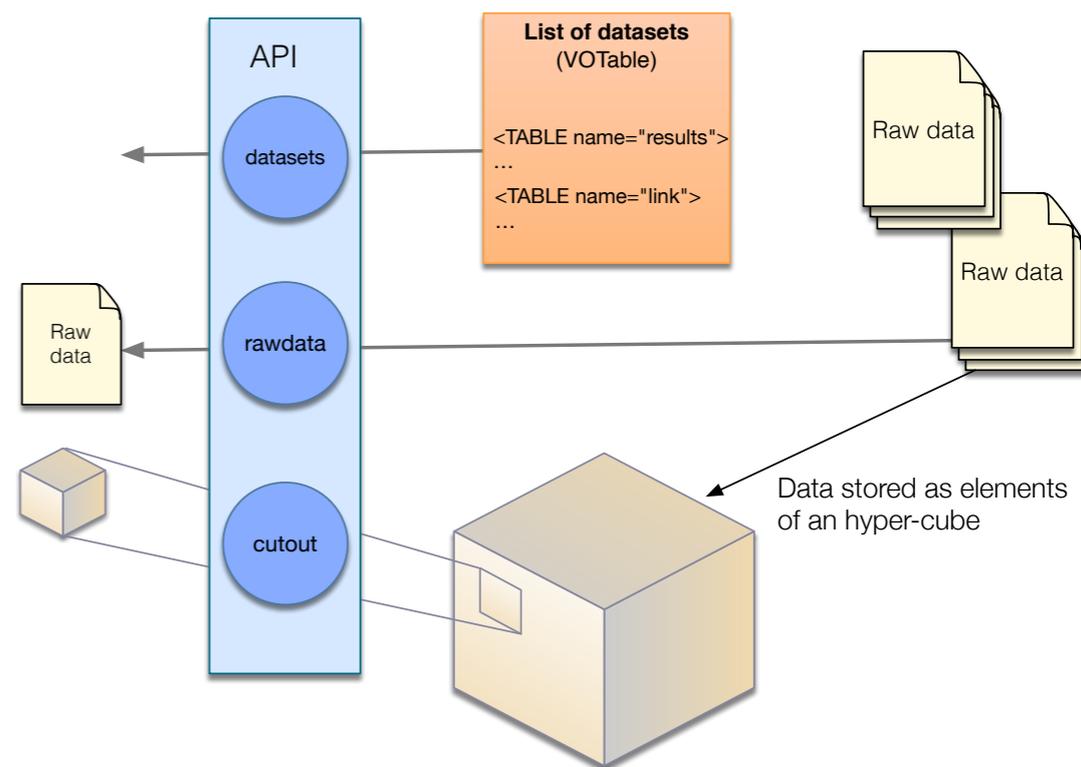

```
curl -H "Content-Type: application/JSON" -d '{
  "where": [
    {":att": "c:effec_temp", ":val": 8E4, ":op": "<="},
    {":att": "c:effec_temp", ":val": 5E4, ":op": ">="}
  ],
  "select": [
    "c:outputdataset_pubdid",
    "c:effect_temp",
    "c:gravity"
  ],
  "orderby": ["c:effect_temp", "asc"]
}'
http://<cutouts_resource>?page_size=5
```

SimDAL Data Access

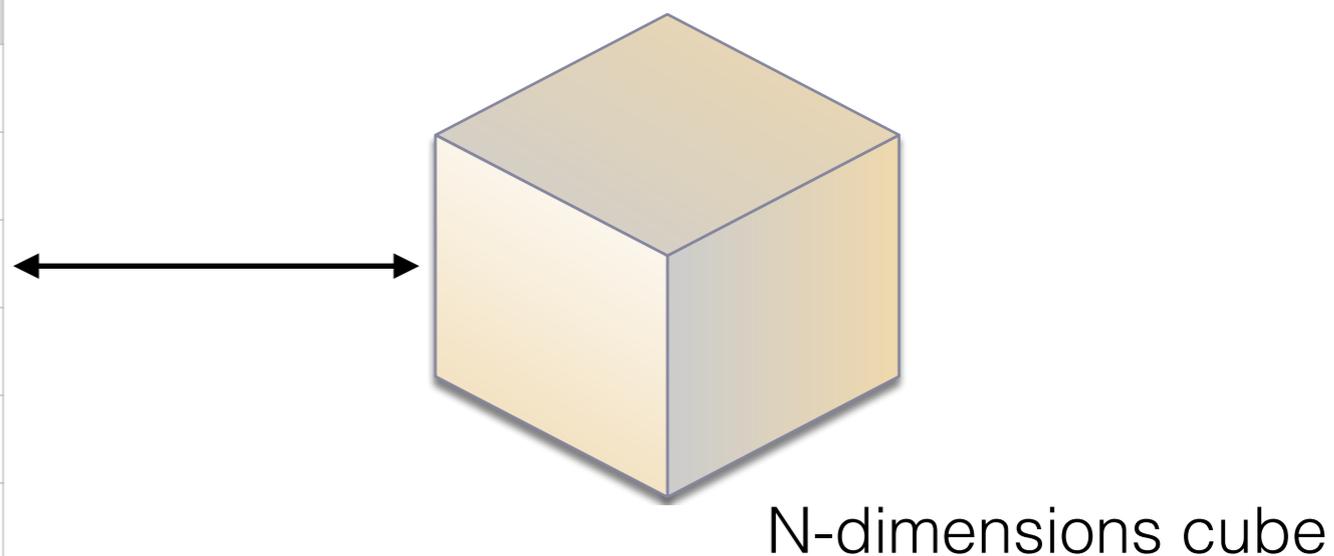

Goal: Retrieve raw data

- {datasets}** • Provide the list of available datasets
- {rawdata}** • Retrieve a full data set / raw data
- {cutouts}** • Extract a sub-set of a dataset / raw data
- {fields}** • Get descriptions of datasets FIELDS

SimDAL Data Access works exactly as the SimDAL Search API

Implementations at Paris Observatory

PDR Code : computation of the atomic and molecular structure of clouds and analysis of physical processes

Computed quantities:

At each position in the cloud:

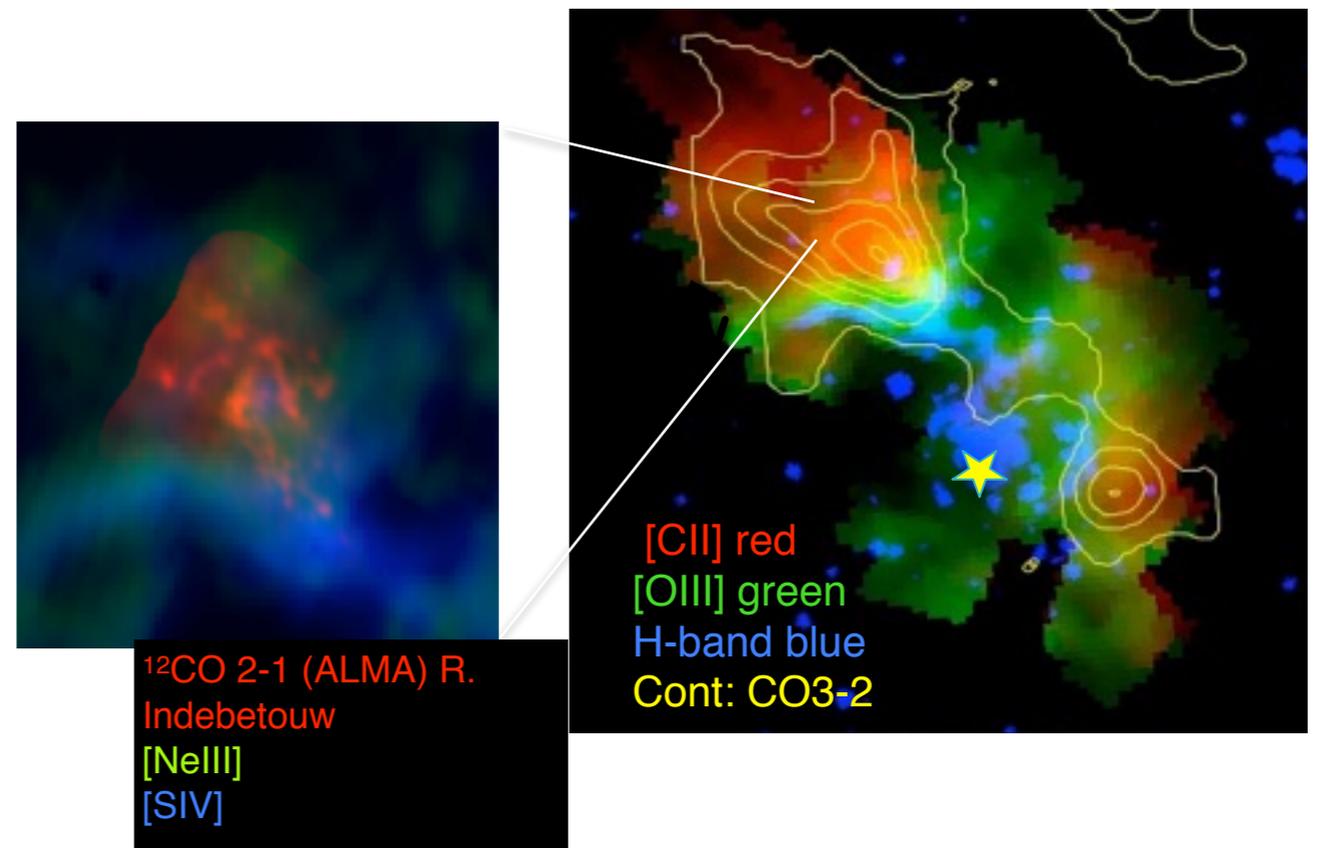

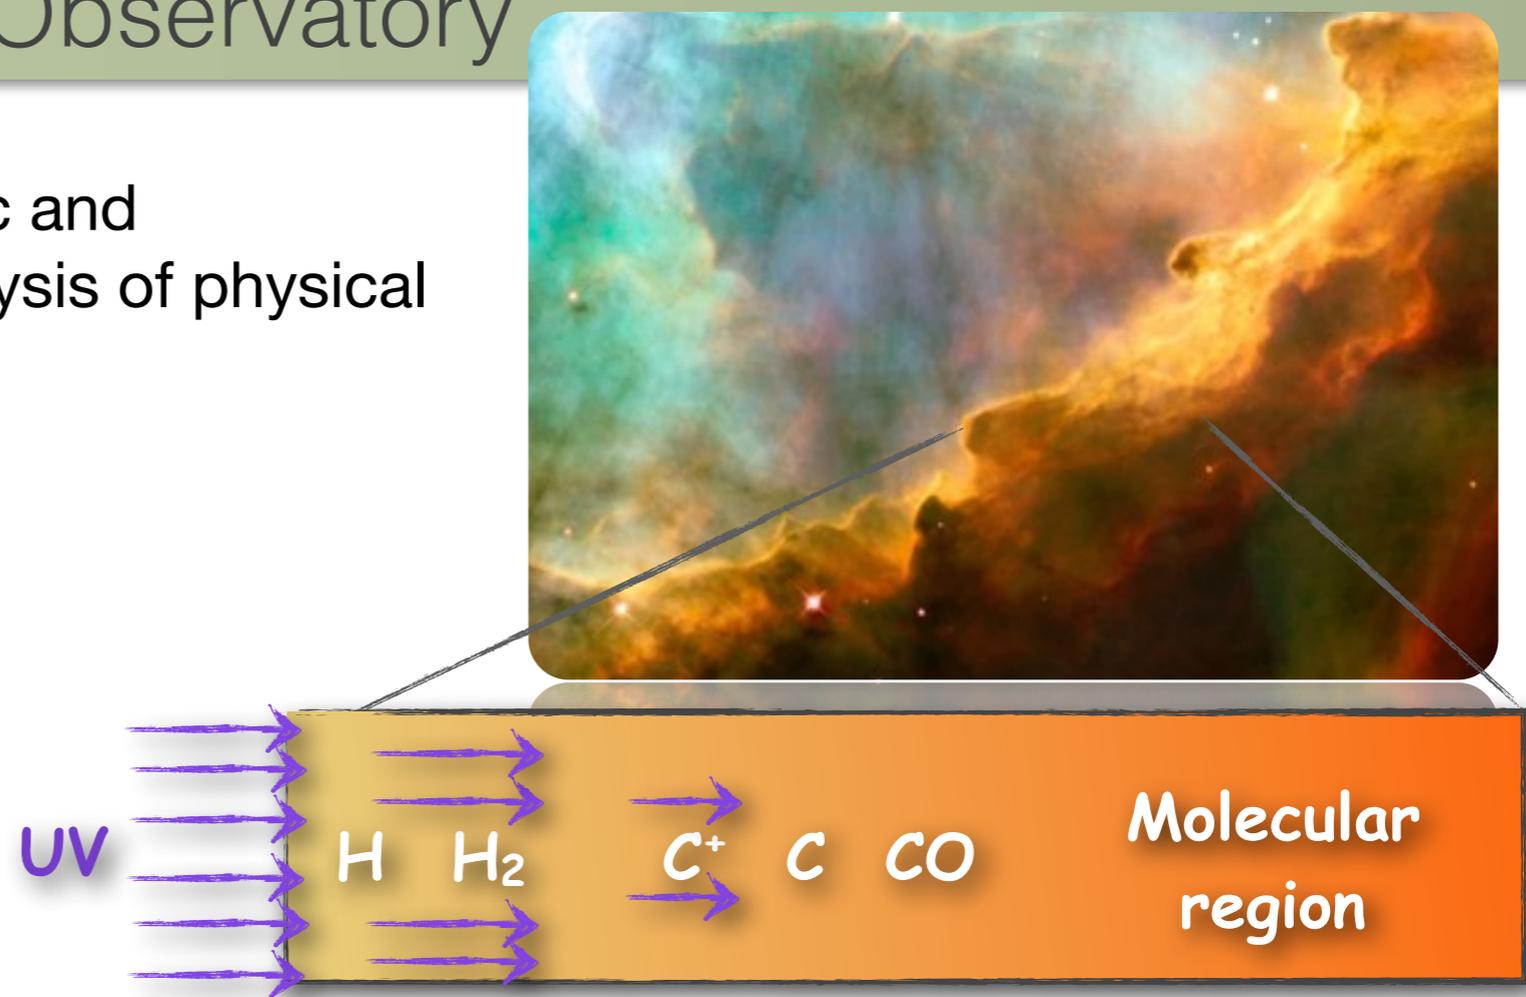

- abundances of chemical species
- excitation in quantum levels
- temperatures (gas & grains)
- ...

On the whole cloud:

- Line intensities (H_2 , CO, H_2O , ...)
- Column densities

Database of PDR models

- thousands models published
- several thousands different physical quantities for each model

Example: Proposal for ALMA

A scientist wants to ask observation time on ALMA

- observation of N159W in the LMC
- wants to observe line intensities of
 - C I at 609 micrometers
 - CO in the transition $J = 2-1$
 - ^{13}CO in the transition $J = 2-1$

To estimate exposure times, he needs theoretical estimations of these line intensities

He wants to find theoretical predictions of these line intensities for interstellar clouds with a pressure 10^7 K cm^{-3} and illuminated by a radiation field ~ 100 times the mean UV radiation field

              The Meudon PDR code is an astrochemical code designed to simulate the interaction between neutral interstellar gas and radiation field under a broad range of conditions (Le Petit et al. 2006). The code considers a stationary 1D slab of dust and gas illuminated by an interstellar radiation field. It computes the chemical and thermal structure of the gas and provides column densities and line intensities of main interstellar species. It is designed to interpret observations from far-UV to mm domain. Version 1.5.2 of the Meudon PDR code introduces many new physical processes compared to previous versions. Absorption in the UV by atomic species as C has been improved. The code considers now a PAH distribution that contributes to heating and surface chemistry. A metallicity parameter has been introduced to model more easily extragalactic media. Atomic and molecular data as well as chemical reaction rates have been updated. The default chemical network takes into account 231 species (including C and O isotopes) linked by 6374 chemical reaction. Surface reactions are not considered by default excepted for H2 and HD. H2 formation model takes into account Eley-Rideal and Langmuir-Hinshelwood mechanisms as described in Le Bourlot et al. (2012).

DIFF51_n_ERLH_isot ism.obspm

Grid of diffuse clouds at constant density

This grid of isochoric PDR 1.5.2 models covers diffuse clouds conditions. Explored parameters are proton density, UV field intensity and size of the clouds. The full grid contains 924 models. Parameteres range are: n from 10 to 1000 cm⁻³, radiation field from 0.5 and 10 times the ISRF, and size (AV) from 0.2 to 3 mag. Both sides of the clouds are illuminated by the same radiation field.

In this grid of PDR models, heating by photo-electric effect on grains is done following the prescription by Bakes and Tielens (2009) with a grain size distribution between 3E-7 cm to 3E-5 cm.

The chemistry takes into account 222 species, including C and O isotopes, linked by 6243 chemical reaction. No surface reactions are considered excepted for H₂. H₂ formation model takes into account Eley-Rideal and Langmuir-Hinshelwood mechanisms as described in Le Bourlot et al. (2012).

These published models give access to all quantities computed by PDR 1.5.2 (line intensities, column densities, densities, temperature of gas and grains, ...)

Cutout in raw data - (SimDAL Data Access)

dataset ID is known from the previous step

http://localhost:3435/api/simdal/DIFF51_n_ERLH_isot/datasets/DM51NoPAH_A2e0p3p5e5r1e2_20_cloud/async/cutouts

The screenshot shows a web browser window with the address bar containing the URL: localhost:3931/data_access/datasets/DM51NoPAH_A2e0p3p5e5r1e2_20_cloud/cutouts. The main content area features a 'Query' section with a text input field containing the following text:

```
inta_00_c_el3p_j1__el3p_j0  
inta_00_co_v0_j2__v0_j1  
inta_00_13c_o_j2__j1
```

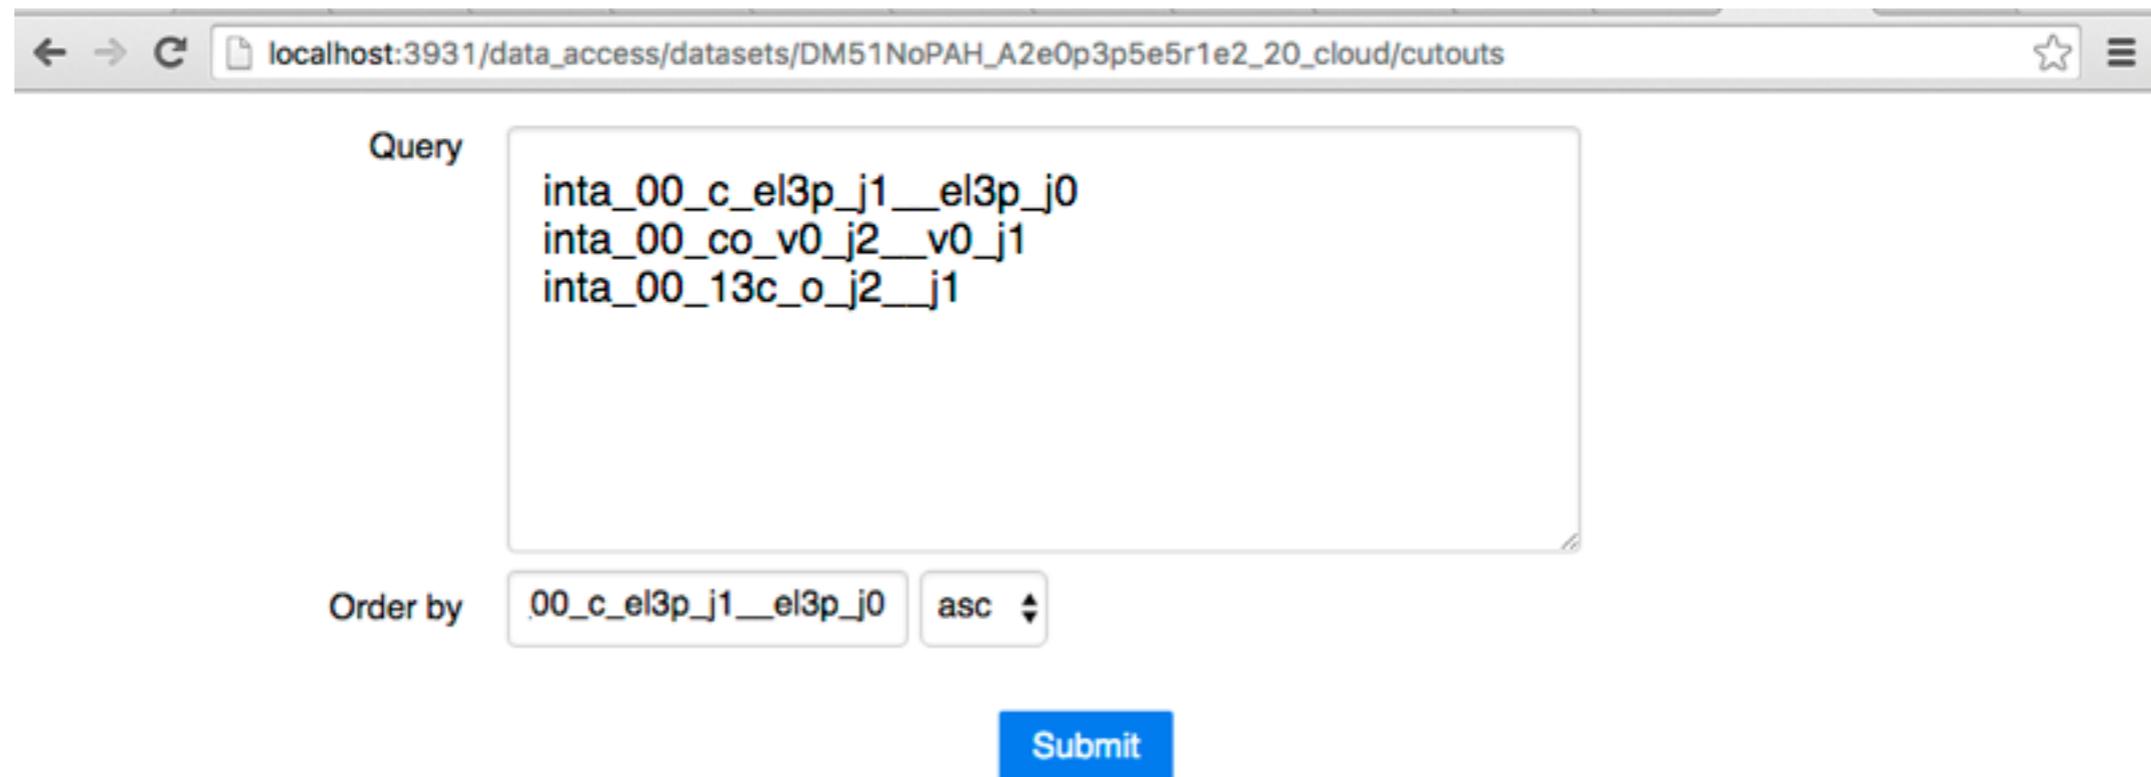

Below the query field is an 'Order by' section with a dropdown menu showing '.00_c_el3p_j1__el3p_j0' and a direction selector set to 'asc'. A blue 'Submit' button is located at the bottom center of the form.

Grid of isobaric PDR 1.5.2 models

This grid of isobaric PDR 1.5.2 models covers photo-dominated regions conditions. Explored parameters are thermal pressure, UV field intensity and size of the clouds. The full grid contains 1372 models. Parameters range are: P from 1E5 to 1E9 K cm⁻³, radiation field from 1 and 1E5 times the ISRF, and size (AV) from 1 to 40 mag. For all models, back side is illuminated by the ISRF. In this grid of PDR models, heating by photo-electric effect on grains is done following the prescription by Bakes and Tielens (2009) without a PAH component. The chemistry takes into account 222 species, including C and O isotopes, linked by 6243 chemical reaction. No surface reactions are considered excepted for H2. H2 formation model takes into account Eley-Rideal and Langmuir-Hinshelwood mechanisms as described in Le Bourlot et al. (2012). These published models give access to all quantities computed by PDR 1.5.2 (line intensities, column densities, densities, temperature of gas and grains, ...).

SAMP

Conclusions

SimDAL 1.0 status at Paris Observatory

- Document SimDAL 1.0
 - still need better explanations on some points
 - typo corrections
- SimDAL Repository ✓
- SimDAL Search ✓
- SimDAL Data Access ✓
- Client (reference ?) ✓
- Dedicated client ✓

Registration of SimDAL services in registries

Detailed registration (Markus)

- requires XSLT transformation of parts of SimDM serializations
- (Gerard proposed to do it)

Simple registration

- register SimDAL services with main descriptive elements
 - Title
 - publisher
 - description
 - ...

In progress at Paris Observatory (David & Pierre Le Sidaner)

Limitations of SimDAL version 1.0

SimDAL version 1.0 answers to the most common scientific use cases.

Nevertheless, it has some limitations that could be addressed in future versions.

SimDAL Repositories

It is not possible to do easily fine searches.

For example: find simulations with *densities as input parameter* and *computing CO line intensities*.

Possible in practice since this information is in the protocol.xml files but require to download these files and search into them.

This could be more convenient.

Limitations of SimDAL version 1.0

SimDAL Search

Not possible to query on other quantities than the ones in the *views*

It would be useful to be able to query on results of operation on these quantities

P1	P2	S1	S2	...	dataset ID
1E+05	1E+03	100	2435	...	
3E+05	1E+03	750	6792	...	
1E+06	1E+03	340	234	...	
3E+06	1E+03	2000	4213	...	
...	

Queries:

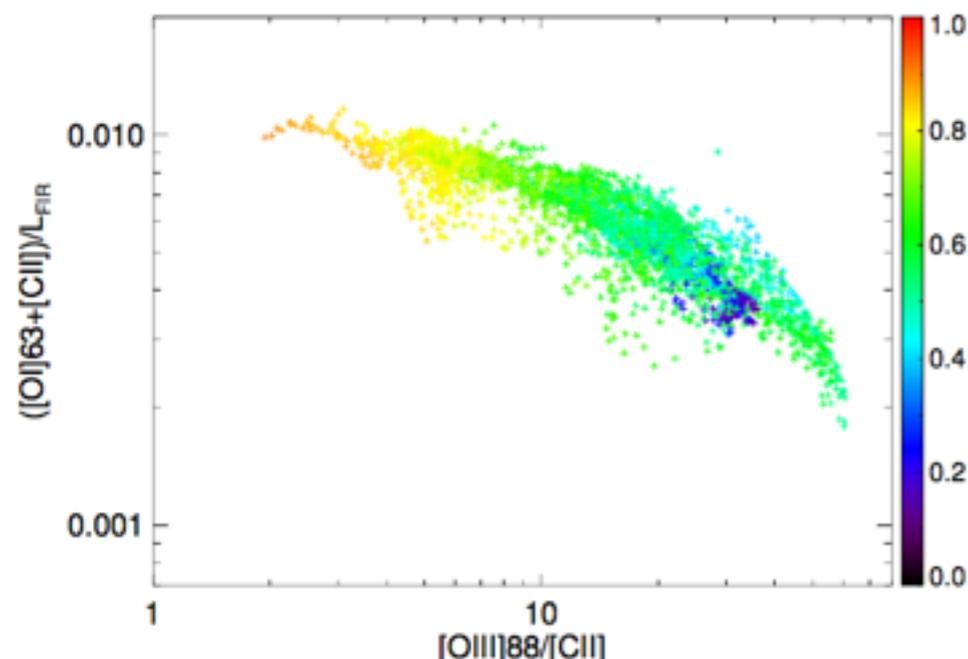

$$100 < S1 < 1000 \text{ \& } 1E3 < S2 < 1E4$$

possible

$$0.01 < S1/S2 < 1$$

not possible

Example:

Interesting quantities are:

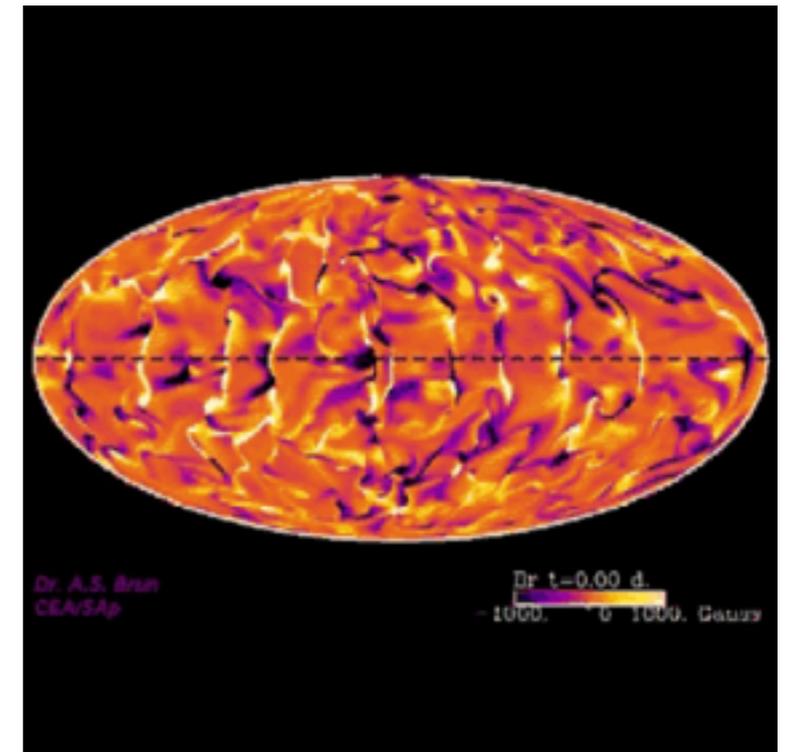

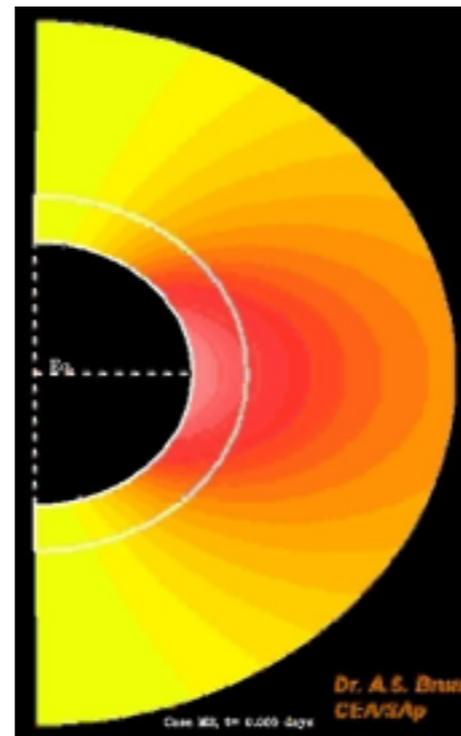

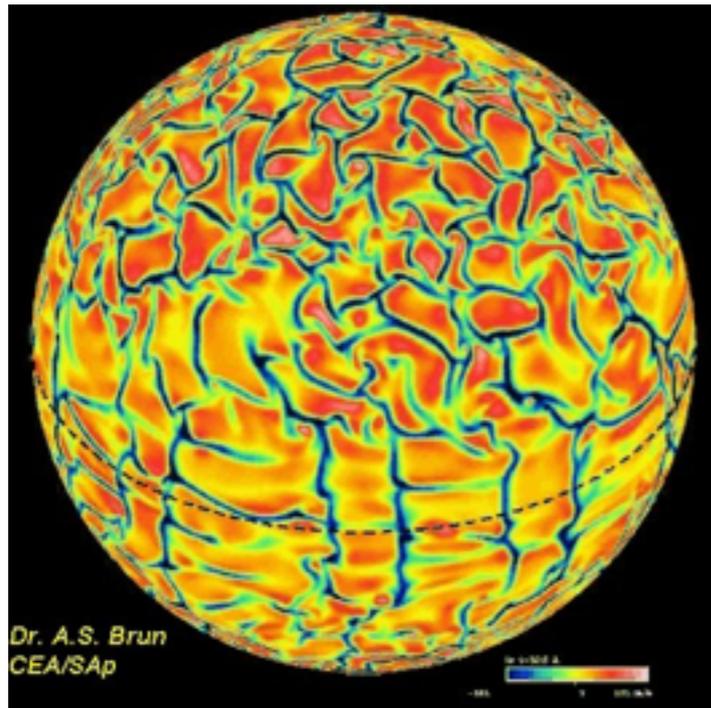

$$\frac{I(O\ 63\ \mu m) + I(C^+)}{L_{FIR}} \quad \text{and} \quad \frac{I(OIII\ 88\ \mu m)}{I(C^+)}$$

Requires to improve the query language

Limitations of SimDAL version 1.0

SimDAL Data Access

- Previews are not part of SimDAL 1.0
- Cutout in spherical, polar etc. coordinates may be useful

Conclusions
