Single dish radio data in the VO and SDFITS

Content

I will review current practices to store single dish data, and it's impact for a VO standard. Most of this is around the SDFITS format, for which there is a 1995 draft standard. In the mean time a few dialects (e.g. the SPECTRUM dialect in CLASS export index fits) have become apparent as well.

Single dish spectra have some relationship to IFU data, this could be explored as well.
