What is "mapping" (supposed to do)?

Why again did we start this? What can we agree on? What really are the problems?

From the VO-DML spec (a standard!)

VO-DML is designed to satisfy the following requirements. It should

1. Support the specification of serialization strategies for serializing instances of data models into different file formats;

- 2. Be rich enough to represent existing IVOA data models;
- 3. Support model reuse;
- 4. Be implementation-neutral, but...

5. Be flexible enough to be mapped to important physical representations, in particular XML schema, relational model (TAP), object-oriented languages (Java, Python...), and at the same time...

6. Be as minimal as possible, avoiding redundancy, adding restrictions where possible, with the aim of simplifying the work of modelers by offering few and "obvious" choices;
7. Be based on accepted standards for data modeling, but ...

8. Not rely on external modeling tools, but be sufficiently compatible with them so that such tools MAY be used when representing models;

9. Support runtime model interpretation;

Some mapping use cases

http://wiki.ivoa.net/twiki/bin/view/IVOA/UtypesTigerTeam

Data Model (de)serialization

UC #1 Serialize DM instances to file: given an instance of a Data Model and the DM machine readable description, a writer can serialize the instance into a number of supported tabular formats. The writer could be a DAL service.

UC #2 Deserialize DM instance from file: given a serialized instance of a Data Model in a supported tabular format and the DM machine readable description, a reader can deserialize the instance into memory, building an object consistent with the DM itself.

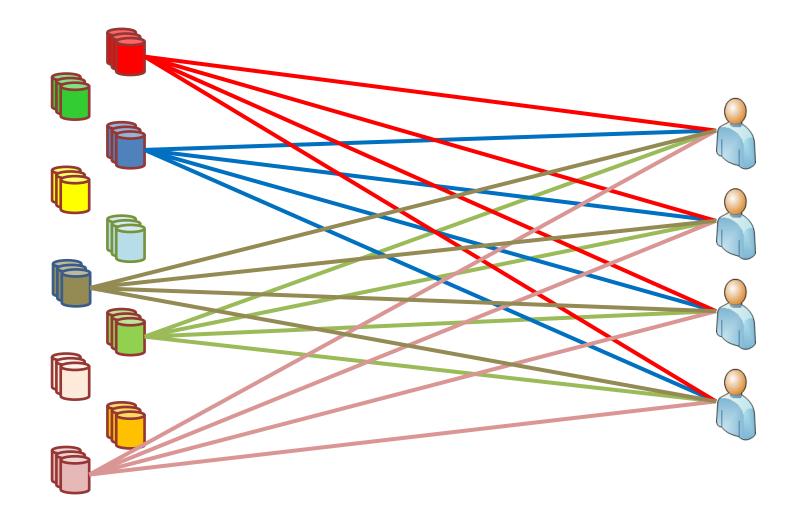

UC #3 Trivial round-tripping: given a serialized instance of a Data Model in a supported tabular format, an I/O library (possibly model-unaware) can convert the instance into a different, supported format without breaking its VO compliance.

UC #4 Represent an arbitrary number of instances of the same class in a DM instance (for example, N instances of the PhotometryFilter class in a PhotometryCatalog instance of the Spectral DM).

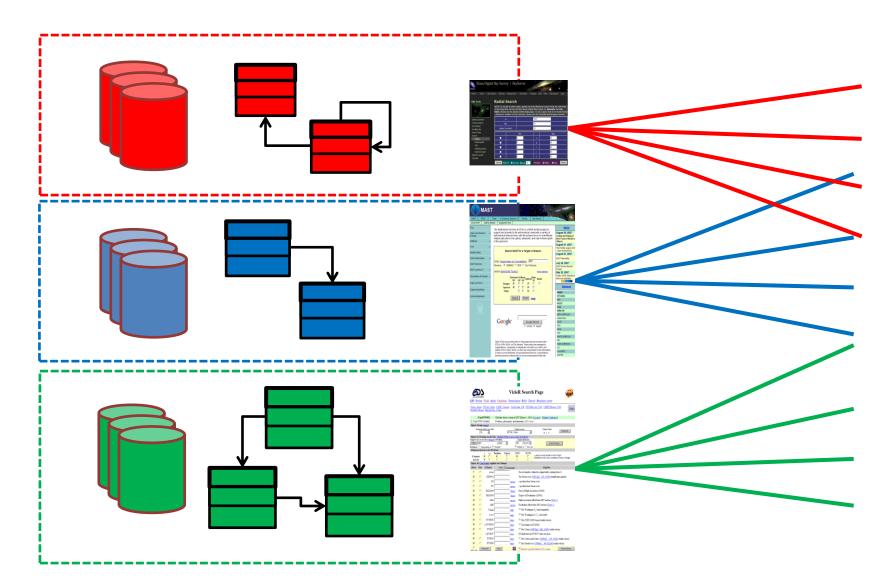

Why are we interested in data models?

Information Integration

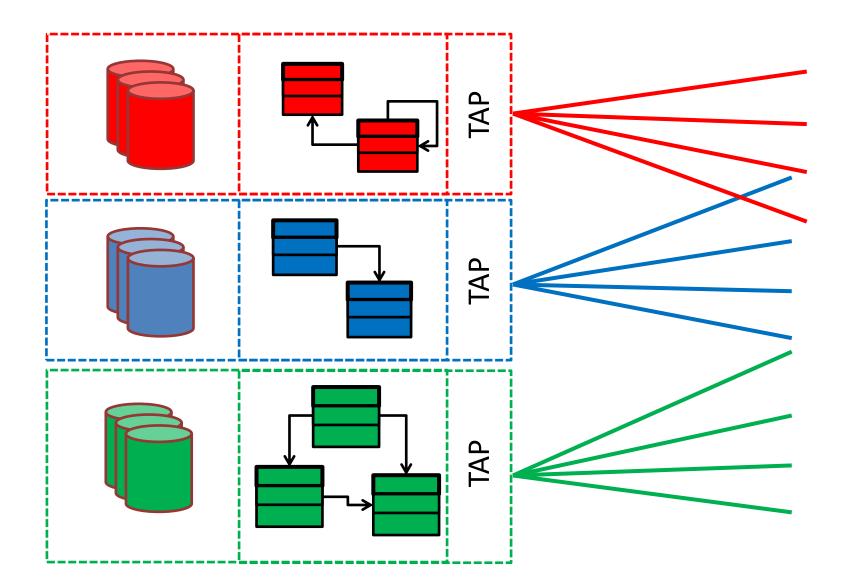

heterogeneity + scaling problem

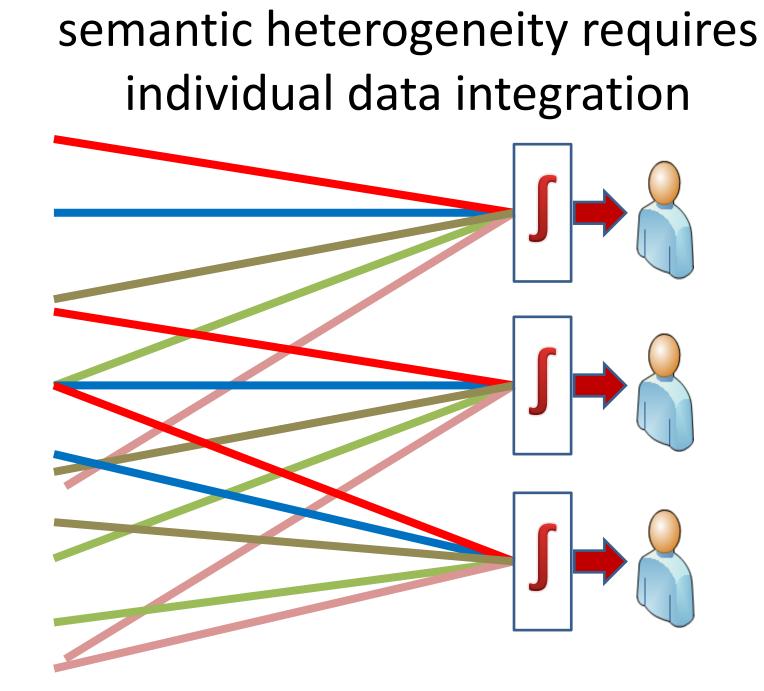

semantic: heterogeneous schemas syntactic: custom access services

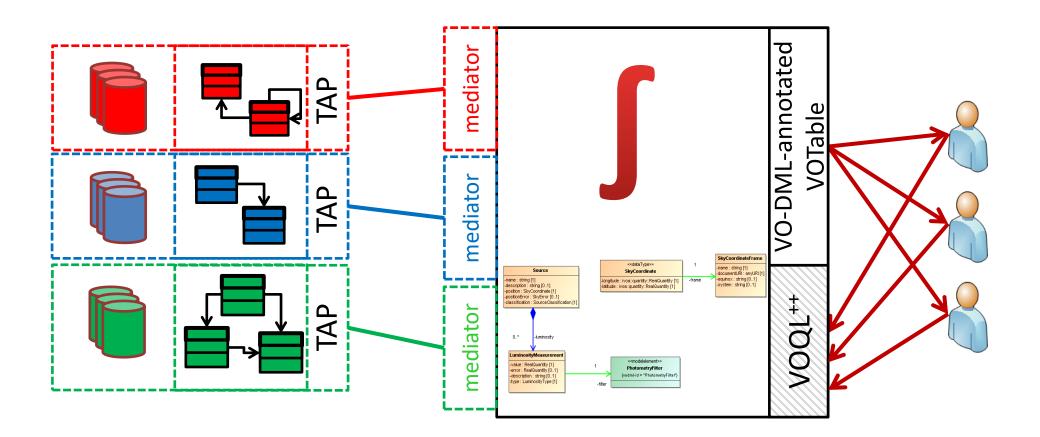

IVOA homogenizes syntax: e.g. TAP

Sketch of Integration Solution: *common (global) schema* + TAP + *mediation* + VOQL⁺⁺ (see lots of CS literature)

Global Schema(s)

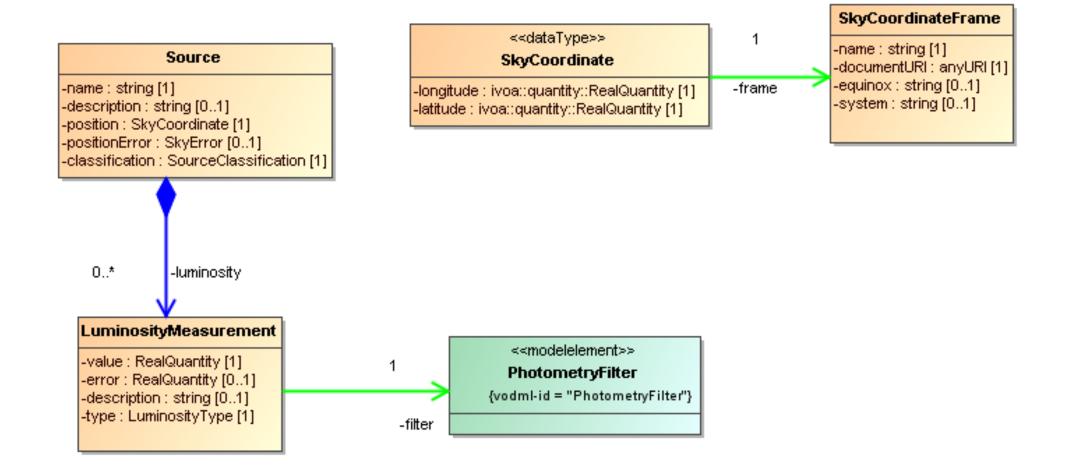

common data model(s)

- The *unified view* of the data sources
- Defined using VO-DML
 - supports model dependency/reuse
 - simplified, XML serialization language: machine readability!
 - Faithful representations possible
 - XSD
 - Java
 - YAML?

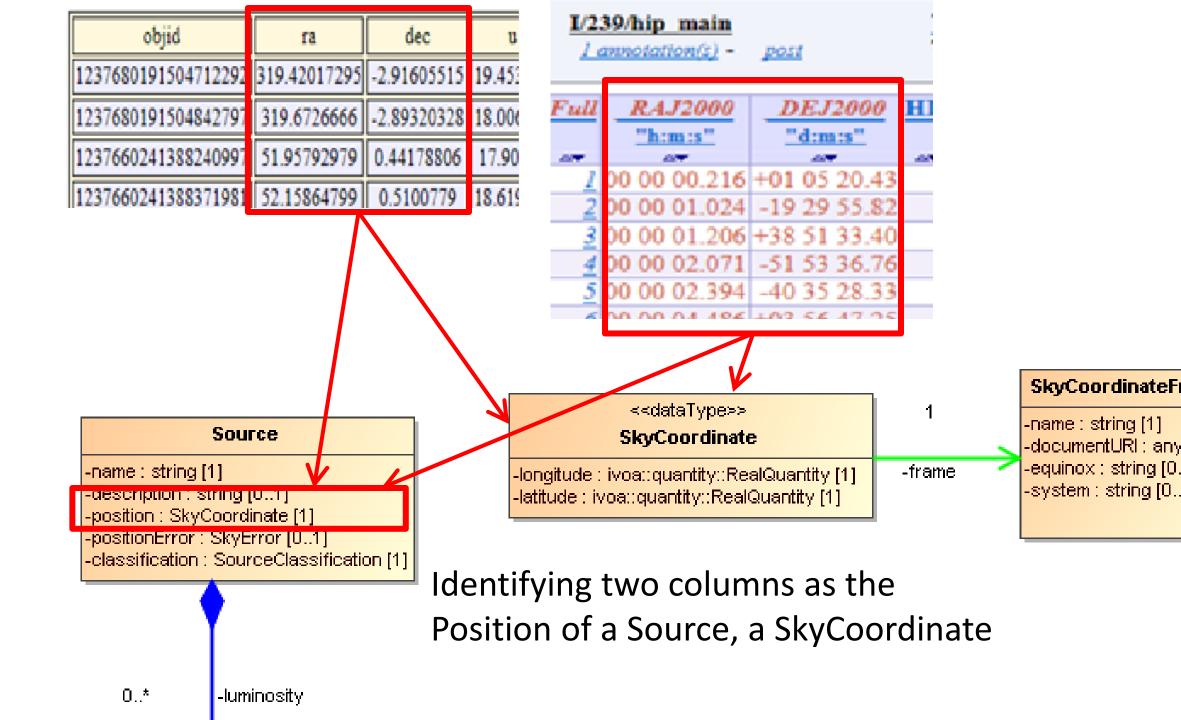

(VO-DML) mapping

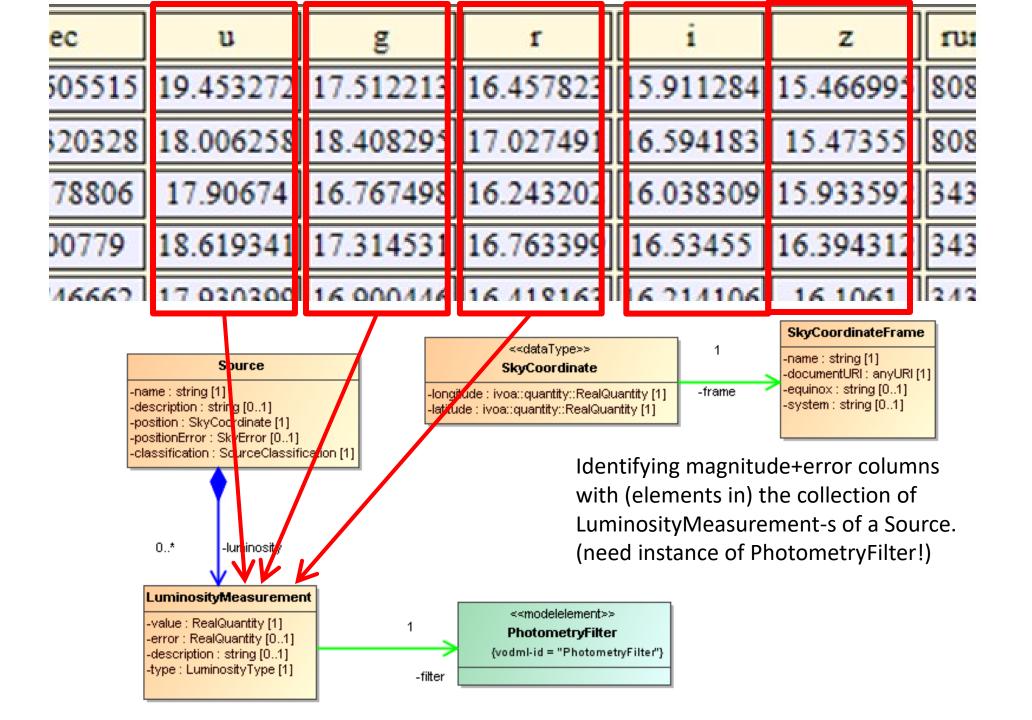

- Expresses how instances of a data model (expressed as VO-DML) are represented in a tabular representation
 - VOTable
 - TAP schema

Example: Simple source data model

Seems straightforward no?

Mapping syntax?

This is what we've been discussing for years now.

So what's the problem?

- Mapping <u>syntax</u>?
 - Maybe
- Or maybe mapping itself
 - Impedance mismatch between data models and data sets

component	serialization
Data model	VO-DML
Data set	VOTable, TAP
Mapping	(proposal)
Use cases	?

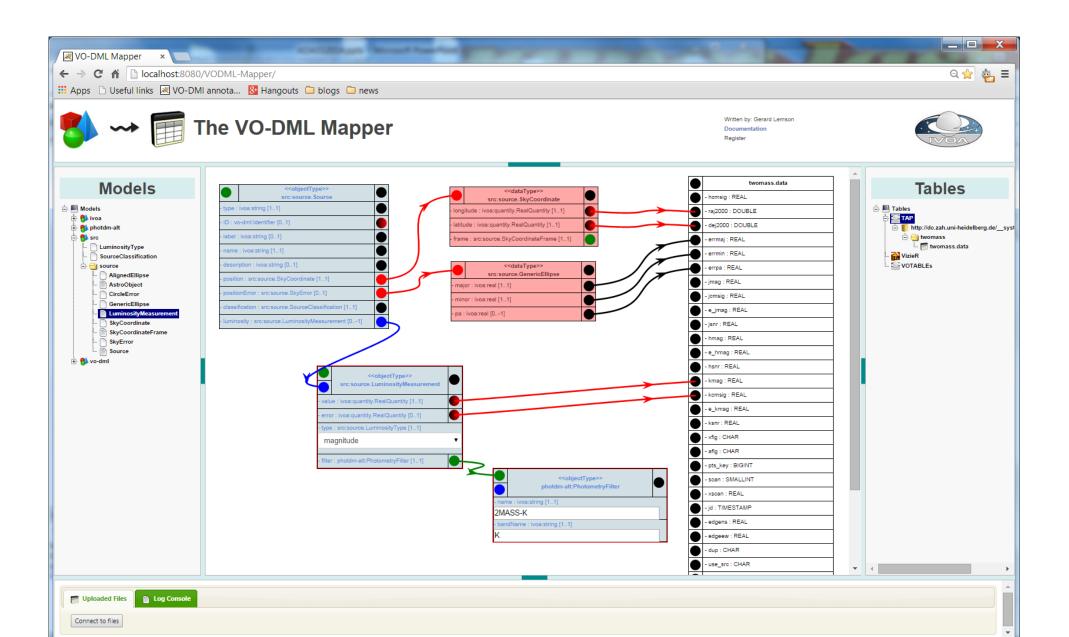

Graphical mapping tool

 allows mapping using drag-and-drop-and-connect from loaded models and TAP schemas/VOTables

• No syntax

• Shows impedance mismatch complexity

http://dsa012.pha.jhu.edu:8081/VODML-Mapper

Examples

http://dsa012.pha.jhu.ed:8081/VODML-Mapper

Done.
