# Writing the Query

**Basic**  
*Near Antares*

**has\_ref**

**ref**

**Author**  
*Name like 'OBERTO'*

```
-- Gets objects and bibcodes around a 'Antares' and having a publication
from 'OBERTO'
SELECT main_id, bibcode
FROM
  (SELECT ra,dec
   FROM basic
   JOIN Ident ON oid=oidref
   WHERE id='ANTARES') AS antares,
  basic AS star
  JOIN has_ref ON oid=oidref
  JOIN ref ON oidbibref=oidbib
  JOIN author USING(oidbibref)
WHERE CONTAINS(POINT('ICRS', star.ra, star.dec)
              , CIRCLE('ICRS', antares.ra, antares.dec, 0.1)) = 1
  AND author.name LIKE 'OBERTO%'
```

# What I get finally: a denormalized table

main_id	bibcode
* alf Sco B	1992BICDS..40...71P
* alf Sco B	1976A&A....46...11A
* alf Sco	1995ApJ...440L..93B
* alf Sco	2005A&A...431..773R
* alf Sco	2002AJ....124.1636K
* alf Sco	1999ApJ...516..817K
* alf Sco	1999ApJS..122..221M
* alf Sco	1994A&A...281..161A
* alf Sco	1994BAAS...26.1455D
* alf Sco	1992BICDS..40...71P
* alf Sco	1984ApJ...276L..21B

Alf Sco B

1992BICDS..40...71P

1976A&A....46...11A

Alf Sco

1995ApJ...440L..93B

2005A&A...431..773R

2002AJ....124.1636K

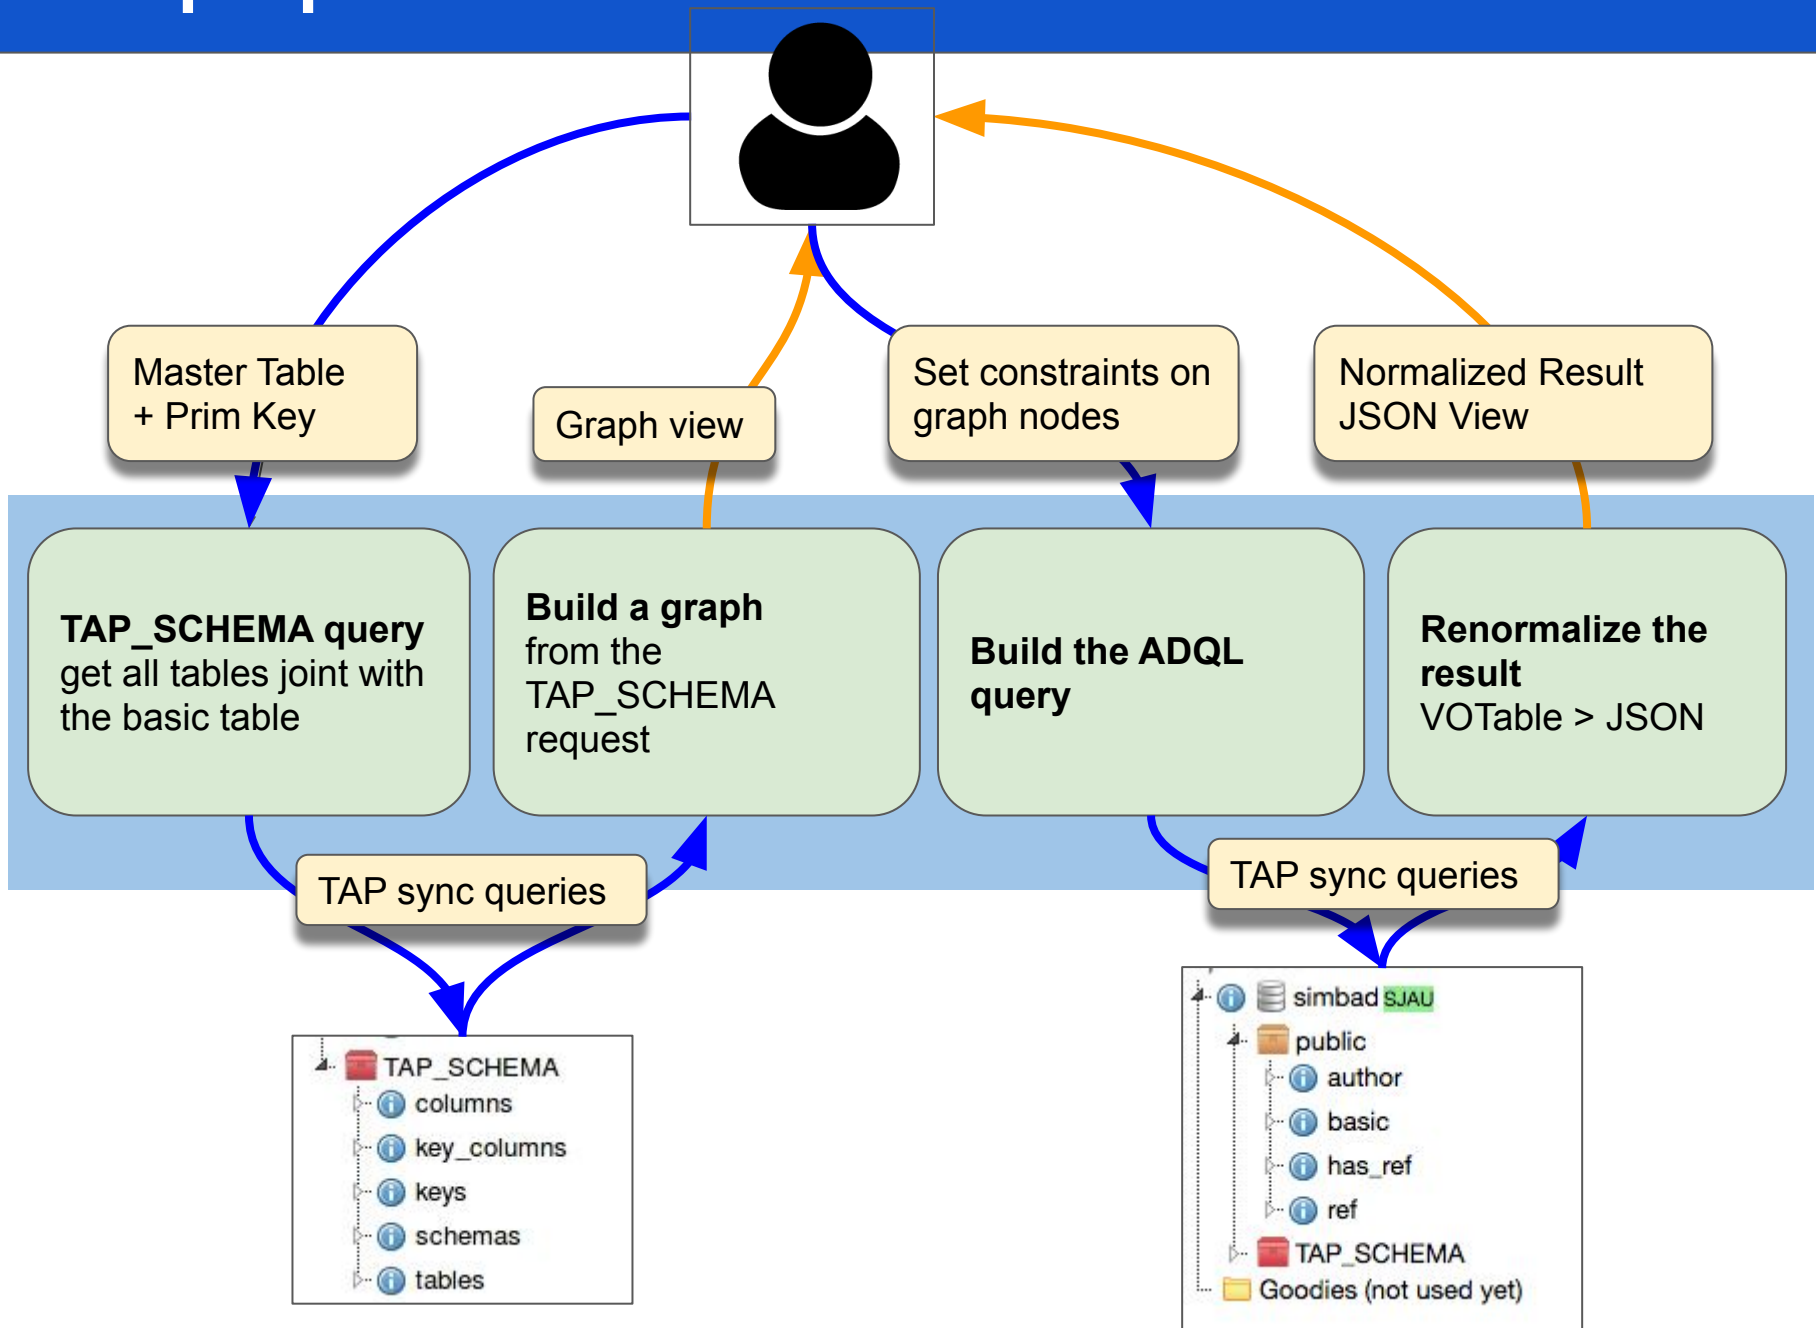

1999ApJ...516..817K

1999ApJS..122..221M

etc

The client has to reconstruct the 1-to-N associations from the denormalized table

# Our proposal

# JSON Graph

```
{
  "basic" :{
    "Keys":{"from": "oid"},
    "rows": [ rows ],
    "joint_tables": [
      "has_ref" :{
        "keys":{"from": "oid", "target":"oidref"},
        "rows": [ rows ],
        "joint_tables": [
          "ref" :{
            "keys":{"from": "oidref", "target":"oidbib"},
            "rows": [ rows ],
            "joint_tables": [
              "authors" :{
                "keys":{"from": "oidbib", "target":"oidbibref"},
                "rows": [ rows ],
                "joint_tables": []
              }
            ]
          }
        ]
      }
    ]
  },
  {...}
]
}
```

- The graph construction follows the table hierarchy
- The exact structure is not validated yet

# The graph view shown up to the user

<b>Table basic</b> <i>Type You constraint here</i>	<input type="text"/>
<b>Table has_ref</b> <i>Type You constraint here</i>	<input type="text"/>
<b>Table ref</b> <i>Type You constraint here</i>	<input type="text"/>
<b>Table author</b> <i>Type You constraint here</i>	<input type="text"/>

- One form for each table
- One constraint editor for each table

- The HTML/CSS design still needs a bit of work :=)

# The graph view shown up the user

<b>Table basic</b> Type You constraint here	<code>CONTAINS (POINT ( ' ICRS '</code>
<b>Table has_ref</b> Type You constraint here	<input type="text"/>
<b>Table ref</b> Type You constraint here	<input type="text"/>
<b>Table author</b> Type You constraint here	<code>name LIKE 'OBERTO%'</code>

- One form for each table
- One constraint editor for each table

```

{
  "basic" :{
    "Keys":{"from": ""},
    "rows": [ rows ],
    "Constraint": "CONTAINS(POINT('ICRS', star.ra, star.dec)
      , CIRCLE('ICRS', antares.ra, antares.dec, 0.1)) = 1",
    "joint_tables": [
      "has_ref" :{
        "keys":{"from": "", "target":""},
        "rows": [ rows ],
        "joint_tables": [
          "ref" :{
            "keys":{"from": "", "target":""},
            "rows": [ rows ],
            "joint_tables": [
              "authors" :{
                "keys":{"from": "", "target":""},
                "rows": [ rows ],
                "constraint": "name LIKE 'OBERTO%'"
                "joint_tables": []
              }
            ]
          }
        ]
      }
    ],
    {...}
  ]
}

```

- Constraints added on graph nodes

# Renormalized result

```
[
{ id : "1234",
  table : "basic",
  fields: { oid: 1234, name= "alf Sco B", ra : 247.35, dec: -26.43]
  join_data:[ { id:"409987",
                table: "has_ref",
                query: "SELECT... FROM has_ref WHERE ... id='1234'
                },
                ...
              ]
},
{ id : "9988",
  table : "basic",
  fields: { oid: 1234, name= "alf Sco B", ra : 247.35, dec : -26.43}
  join_data:[ { id:"409987",
                table: "has_ref",
                query: "SELECT... FROM has_ref WHERE ... id=9988
                },
                ...
              ]
}
]
```

- A collection of unique primary objects from the master table
- Component can be show up by URLs
- Thes limits the resulst size and avoid to gte the whole database for service highly connected (e.g. Simbad)

## TAP TEST Obas

Simbad  TOP 100 GAVO  TOP 100 VizieR  TOP 100 CAOM  TOP 100

```
{
  "rr.alt_identifier": {
    "join_tables": {
      "rr.resource": {
        "columns": [],
        "constraints": "",
        "from": "ivoid",
        "target": "ivoid"
      }
    }
  },
  "rr.authorities": {
    "join_tables": {
      "rr.registries": {
        "columns": [],
        "constraints": "",
        "from": "ivoid",
        "target": "ivoid"
      }
    }
  },
  "rr.capability": {
    "join_tables": {
      "rr.resource": {
        "columns": [],
        "constraints": ""
```

- **Work in progress**
- **Might be a first step toward the capability of retrieving complete object instances from TAP services**
  - Use of UTYpes/VODML identifiers to build the graph

"constraints": "",

- **Work in progress**
- **TAP services targeted**
  - Simbad
  - R Registry
  - CAOM
  - XCatDB
  - Any other service with connected tables
- **Implementation**
  - Module Javascript
  - To be used with TAPSimbad and TAPHandle
  - Could be used with other interfaces
