- Task to include photometry data in VO context
- This is an old and recurrent request of astrophysical community. One of the main topics raised during community workshops. One of the topics raised by the IVOA Take-up Committee
- First task, creation of a simple data model that add the missing boxes to handle photometry into VO (See Salgado talk at DM)
- Creation of servers providing photometric data and giving access to photometry filter details. Two partners on this task: SVO & CDS (see DM session and also S. Derriere presentation at Apps2)
- Modification of a SSA client (VOSpec v6.5b3) to consume these services as a probe of concept and extensible to operational use
- Content of this presentation is more on how we are doing it than in what we are doing it!

Photometry use case I: Synthetic Photometry

Give me list of registered Filters
(possible constrained by wavelength range)

Response, VOTable (VOResource?)

Show filters so user can select

Give Details for a certain filter list

Response, VOTable (VOResource?)
Including link to Transmission curve

Use filter
Details to create synthetic photometry points using real/model
spectra as input

VOSpec and Filter Profile Service: Synthetic photometry

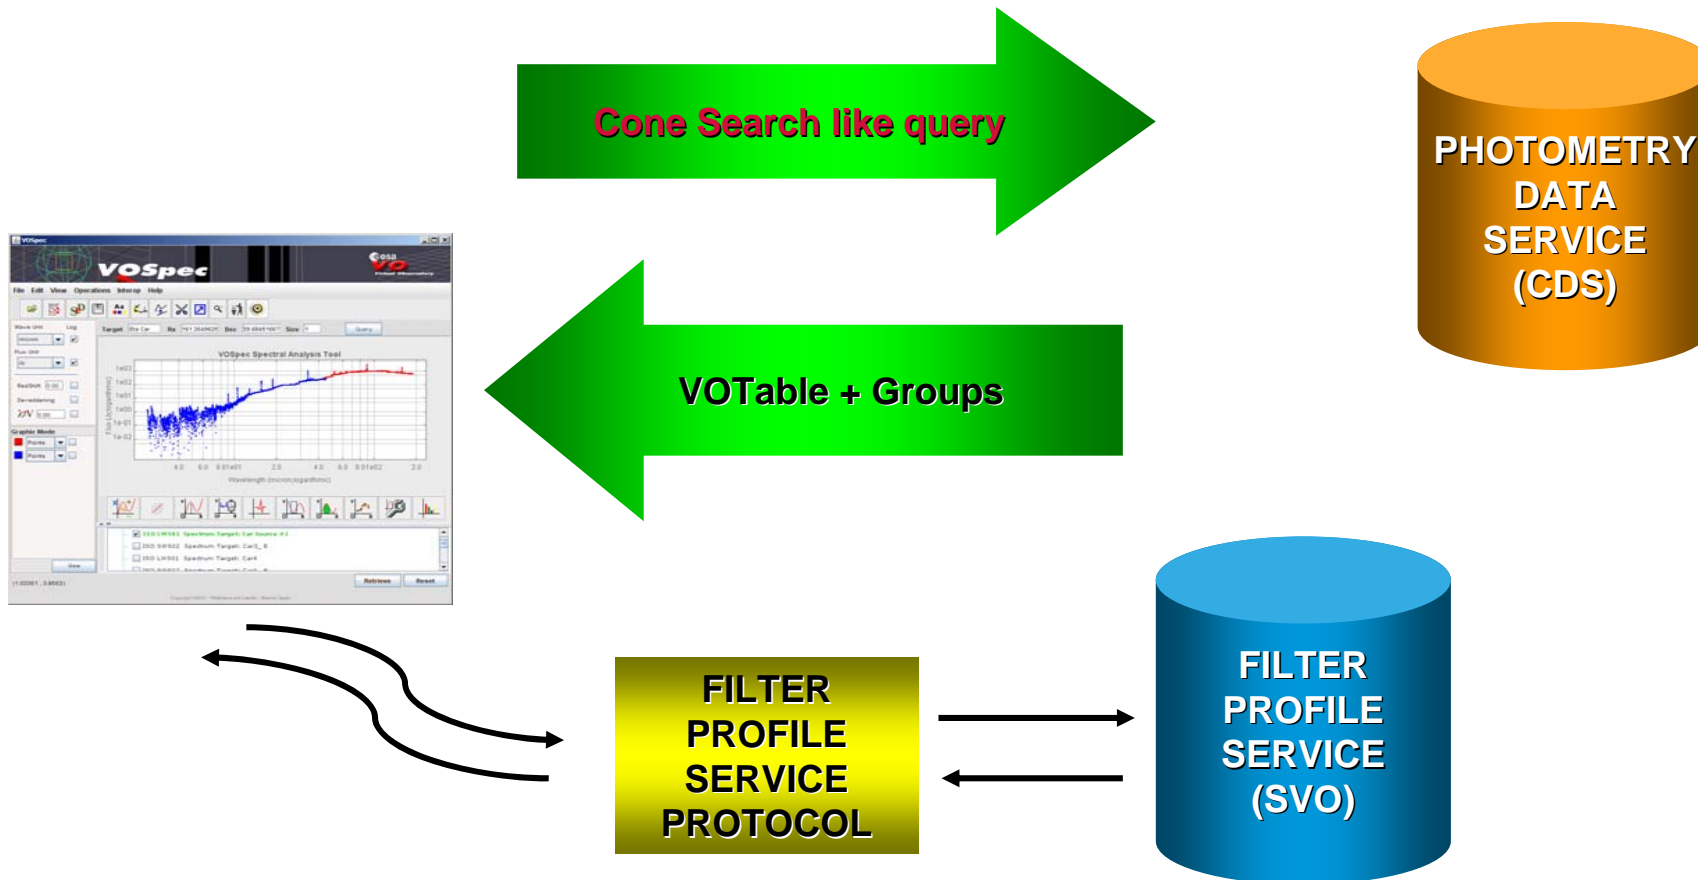

DEMO1

Photometry use case II: Photometry Data Services

Photometry use case II: Photometry Data Services

Cone search approach and note

- As part of EuroVO-ICE activities, a note on how to add photometry characterization in groups in a VOTable output of a catalog query response
- These groups, including the relevant utypes of the Photometry DM WD are used in VOSpec to handle the photometric information
- More than 200 catalogs are being adapted in Vizier to include this information (acknowledge to F. Ochsenbein and S. Derriere) (ASU syntax for queries)
- Some of them have been already included in VOSpec. Server selector to be modified to handle properly so many catalogs
- [UGC2826_2MASS_phot.xml](#)
- [UGC2826_NVSS_phot.xml](#)

DEMO2

- The access to photometric data was an old requirement from the community
- Main source of photometry comes from catalogs
- Combination of a specific Photometry DM, the already existing Spectrum DM, and DAL protocols can make this a reality
- 3 DAL protocols possible candidates: Cone Search with a relevant extension, SSAP and, possible in the future, TAP using that extension
- A new capability (photometry) has been presented to DAL on a note (S. Derriere et al) and explored on the server and client sides
- For the first time, we are trying to access photometric data in a agreed IVOA environment and a specific standard can now be developed in this line

THANK YOU

Jesus Salgado
