# Identifiers in VizieR

## Identifiers provided by VizieR

- The catalogue name :  
example : I/345 (Gaia DR2)  
J/A+A/414/699 (catalogue A&A)
- The bibcode : shared with ADS  
2018A&A...616A...1G (Gaia DR2)  
2004A&A...414..699C (catalogue A&A)
- The ivoid (VO-registry)  
[ivo://cds.vizier/i/345](http://ivo://cds.vizier/i/345) (Gaia DR2)  
[ivo://cds.vizier/j/a+a/414/699](http://ivo://cds.vizier/j/a+a/414/699) (catalogue A&A)

## External identifiers (available in VizieR)

(added recently in VizieR metadata and updated from ADS database)

- Article DOI
- First author Orcid

## To generate DOI

- DOI registration organisation : Datacite  
<https://www.datacite.org/>

Only members can create DOI (in France, INIST (CNRS))

INIST: Institut de l'Information Scientifique et Technique  
<http://www.inist.fr/?Attribution-de-DOI&lang=fr>

- Recommendation given by INIST (CNRS):
  - Define the type, workflows of the DOI targeted
  - Verify the relevance of the cited object  
(granularity level? does the object merit to be cited?)
  - Data & metadata quality:  
→ list the metadata and verify if they are compliant with the ethics

# To generate DOI

## Some requirements

- Stable URL
- Long-term preservation
- Access to the objects through the "landing pages"
- *(INIST) Meta-data must be available and subject to a CCO licence*  
=> no restrictions on reuse of the metadata

# □ Why a VizieR DOI ?

## To take advantage of DOI

- DOI is a standard : it is commonly used by authors to cite data in article
- Search engine (datacite: <https://www.datacite.org/>)
- The URL redirection mechanism to a “landing page”
- DataCite provides statistics : <https://stats.datacite.org/#tab-resolution-report>

Secure | <https://stats.datacite.org>

DataCite Statistics Support 

Registrations by Allocators		Registrations by Datacentres		Registrations by Prefixes		Resolutions by Month

# □ What is a VizieR DOI ?

## What is VizieR DOI ?

**Granularity** : the catalogue (!= table in the IVOID registry)

- table can be subject to transformation even after publication (example : fusion)
- Include the whole catalogue :
  - The data : tables, associated data (FITS, spectra, images)
  - The metadata (ReadMe) : coordinates, filters, time, ...
  - Added values : links, plots....
- The services to access the data :
  - VO : SCS, TAP, SIA, SSA, ObsTAP, MOC
  - FTP
  - Dedicated web application

A composite screenshot of the VizieR web application. The top right shows a 'VizieR Result Page' with a table of search results for '2MASS J0000-0000'. The bottom right shows a 'Photometry viewer' plot with data points in red, green, and blue. The bottom left shows a 'X-Match Service' interface for cross-matching catalogues. The overall interface is white with blue and grey accents, typical of scientific web tools.

# DOI metadata

A joint effort with the VizieR team - documentalists + engineer

- The VizieR DOI syntax :  
DataCite encourages DOI publishers to use a sufficiently opaque suffix
  - example : 
  - DOI is persistent  
=> Opaque suffix is preferable to avoid information in the identifier
    - e.g. : catalogue removed after being published in VizieR
- Define DOI metadata AND metadata in the landing page  
→ Privilege meta-data in the landing-page rather than DOI metadata
  - more flexible !
  - What are the benefits to put all metadata in DOI ?  
(example : abstract, ..)

# □ DOI metadata

- Datacite provides the MDS service (Metadata Store) to register DOI associated with metadata.
- DOI Metadata are gathered into a XML document :  
[http://schema.datacite.org/meta/kernel-4/doc/DataCite-MetadataKernel\\_v4.0.pdf](http://schema.datacite.org/meta/kernel-4/doc/DataCite-MetadataKernel_v4.0.pdf)

## Metadata subject to a particular attention in the VizieR context

- Remove abstract from DOI-metadata because abstract could be subject to licences 
- Related identifiers :
  - Alternative identifiers : **bibcode**, **IVOID**
  - Link external identifiers with the relationship type:
    - **DOI** : the Datacite XML schema provides a rich grammar :  
*IsCitedBy, IsSupplementTo, IsSupplementedBy, IsContinuedBy, IsPartOf, HasPart, IsReferencedBy, ...*
    - Use «*IsSupplementTo*» relation to link VizieR catalogues with published articles

```
<relatedIdentifier relatedIdentifierType="DOI" relationType="IsSupplementTo">
    10.1051/0004-6361:20031671
</relatedIdentifier>
```
    - **Orcid** of the first author enables link (URL resolution similar than DOI)

→ populate DOI & Orcid in VizieR from **ADS**

Library of flux-calibrated echelle spectra of southern late-type dwarfs with different activity levels.

Article DOI : 10.1051/0004-6361:20031671

Keywords : atlases - stars: late-type

Abstract: We present Echelle spectra of 91 late-type dwarfs, of spectral types from F to M and of different levels of chromospheric activity, obtained with the 2.15-m telescope of the CASLEO Observatory located in the Argentinean Andes. Our observations range from 3890 to 6690Å, at a spectral resolution from 0.141 to 0.249Å per pixel ( $R=\lambda/\Delta\lambda \sim 26400$ ). The observations were flux calibrated with the aid of long slit spectra ( $R \sim 1050-2070$ ), also available.

Gala data release 2 (Gaia DR2).

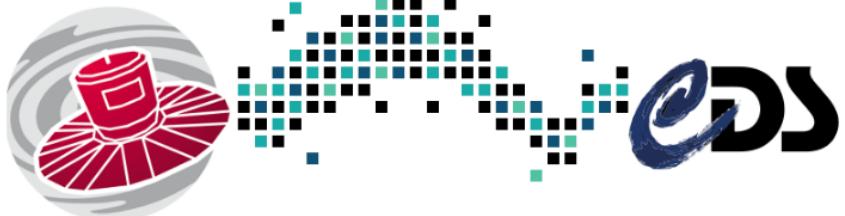

Article DOI : [10.1051/0004-6361/201833051](#)

Keywords : catalogs - astrometry - techniques: radial velocities - stars: fundamental parameters - stars: variables: general - minor planets, asteroids: general

Abstract: Gaia Data Release 2. Summary of the contents and survey properties: We present the second Gaia data release, Gaia DR2, consisting of astrometry, photometry, radial velocities, and information on astrophysical parameters and variability, for sources brighter than magnitude 21. In addition epoch astrometry and photometry are provided for a modest sample of minor planets in the solar system. A summary of the contents of Gaia DR2 is presented, accompanied by a discussion on the differences with respect to Gaia DR1 and an overview of the main limitations which are still present in the survey. Recommendations are made on the responsible use of Gaia DR2 results. ...[\(more\)](#)

# □ TODO

## Finalise the VizieR DOI workflow

- Signature of the contract with INIST (CNRS)
- Include the DOI workflow into the VizieR ingestion workflow
  - DataCite provide a test environment (available for members)
    - A web page (requiring authentication)
    - MDS API : REST API <https://mds.datacite.org>

(requires organisations to first register for an account with a DataCite member)

- Generate our first DOI : a DOI for VizieR
- DOI Generation won't be automated in a first step..
- Take into account the sustainability of DOI
  - landing page must be sustainable .
  - create a generic deprecated VizieR page for removed catalogue (after publication)

A screenshot of the DataCite Metadata Store interface. At the top, there's a logo for 'DataCite' and the title 'Metadata Store'. Below that, a sidebar has links like 'Ensemble De Données', 'Enregistrer nouveau', 'Afficher', and 'Documentation sur l'API'. The main area is titled 'Enregister nouveau Ensemble de données'. It contains fields for 'DOI' (with a placeholder '10.5672'), 'Adresse URL' (with a placeholder 'http://'), and 'Téléversement d'entités XML' (with a 'Parcourir' button and a note 'Aucun fichier sélectionné'). There's also a note about DOI latency and a warning about using a specific prefix for testing. At the bottom, there's a large 'ENREGISTRER' button.
